LDAP "Who am I?" Operation
<draft-zeilenga-ldap-authzid-10.txt>

Status of this Memo

This document is intended to be, after appropriate review and revision, submitted to the RFC Editor as a Standard Track document. Distribution of this memo is unlimited. Technical discussion of this document will take place on the IETF LDAP Extensions mailing list <ldapext@ietf.org>. Please send editorial comments directly to the author <Kurt@OpenLDAP.org>.

By submitting this Internet-Draft, I accept the provisions of Section 4 of RFC 3667. By submitting this Internet-Draft, I certify that any applicable patent or other IPR claims of which I am aware have been disclosed, or will be disclosed, and any of which I become aware will be disclosed, in accordance with RFC 3668.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

Abstract

This specification provides a mechanism for Lightweight Directory
Access Protocol (LDAP) clients to obtain the authorization identity which the server has associated with the user or application entity. This mechanism is specified as an LDAP extended operation called the LDAP "Who am I?" operation.

Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119].

1. Background and Intent of Use

This specification describes a Lightweight Directory Access Protocol (LDAP) [RFC3377] operation which clients can use to obtain the primary authorization identity in its primary form which the server has associated with the user or application entity. The operation is called the "Who am I?" operation.

This specification is intended to replace the existing [AUTHRESP] mechanism which uses Bind request and response controls to request and return the authorization identity. Bind controls are not protected by the security layers established by the Bind operation which includes them. While it is possible to establish security layers using Start TLS [RFC2830] prior to the Bind operation, it is often desirable to use security layers established by the Bind operation. An extended operation sent after a Bind operation is protected by the security layers established by the Bind operation.

There are other cases where it is desirable to request the authorization identity which the server associated with the client separately from the Bind operation. For example, the "Who am I?" operation can be augmented with a Proxied Authorization Control [PROXYAUTH] to determine the authorization identity which the server associates with the identity asserted in the Proxied Authorization Control. The "Who am I?" operation can also be used prior to the Bind operation.

Servers often associate multiple authorization identities with the client and each authorization identity may be represented by multiple authzId [RFC2829] strings. This operation requests and returns the authzId the server considers to be primary. In the specification, the term "the authorization identity" and "the authzId" are generally to be read as "the primary authorization identity" and the "the primary authzId", respectively.
2. The "Who am I?" Operation

The "Who am I?" operation is defined as an LDAP Extended Operation [RFC2251, Section 4.12] identified by the whoamiOID Object Identifier (OID). This section details the syntax of the operation's whoami request and response messages.

\[
\text{whoamiOID ::= "1.3.6.1.4.1.4203.1.11.3"}
\]

2.1. The whoami Request

The whoami request is an ExtendedRequest with the requestName field containing the whoamiOID OID and an absent requestValue field. For example, a whoami request could be encoded as the sequence of octets (in hex):

\[
\begin{align*}
30 & 1e 02 01 02 77 19 80 17 31 2e 33 2e 36 2e 31 \\
& 2e 34 2e 31 2e 34 32 30 33 2e 31 2e 31 2e 33
\end{align*}
\]

2.2. The whoami Response

The whoami response is an ExtendedResponse where the responseName field is absent and the response field, if present, is empty or an authzId [RFC2829]. For example, a whoami response returning the authzId "u:xxyyz@EXAMPLE.NET" (in response to the example request) would be encoded as the sequence of octets (in hex):

\[
\begin{align*}
30 & 21 02 01 02 78 1c 0a 01 00 04 00 04 00 8b 13 \\
& 75 3a 78 78 79 79 7a 40 45 58 41 4d 50 4c 45 2e \\
& 4e 45 54 45 54 49 53 48
\end{align*}
\]

3. Operational Semantics

The "Who am I?" operation provides a mechanism, a whoami Request, for the client to request that the server returns the authorization identity it currently associates with the client and provides a mechanism, a whoami Response, for the server to respond to that request.

Servers indicate their support for this extended operation by providing whoamiOID object identifier as a value of the 'supportedExtension' attribute type in their root DSE. Server SHOULD advertise this extension only when the client is willing and able to perform this operation.
If the server is willing and able to provide the authorization identity it associates with the client, the server SHALL return a whoami Response with a success resultCode. If the server is treating the client as an anonymous entity, the response field is present but empty. Otherwise the server provides the authzId [RFC2829] representing the authorization identity it currently associates with the client in the response field.

If the server is unwilling or unable to provide the authorization identity it associates with the client, the server SHALL return a whoami Response with an appropriate non-success resultCode (such as operationsError, protocolError, confidentialityRequired, insufficientAccessRights, busy, unavailable, unwillingToPerform, or other) and an absent response field.

As described in [RFC2251] and [RFC2829], an LDAP session has an "anonymous" association until the client has been successfully authenticated using the Bind operation. Clients MUST NOT invoke the "Who Am I?" operation while any Bind operation is in progress, including between two Bind requests made as part of a multi-stage Bind operation. Where a whoami Request is received in violation of this absolute prohibition, the server should return a whoami Response with an operationsError resultCode.

4. Extending the "Who am I?" operation with controls

Future specifications may extend the "Who am I?" operation using the control mechanism [RFC2251]. When extended by controls, the "Who am I?" operation requests and returns the authorization identity the server associates with the client in a particular context indicated by the controls.

4.1. Proxied Authorization Control

The Proxied Authorization Control [PROXYAUTH] is used by clients to request that the operation it is attached to operates under the authorization of an assumed identity. The client provides the identity to assume in the Proxied Authorization request control. If the client is authorized to assume the requested identity, the server executes the operation as if the requested identity had issued the operation.

As servers often map the asserted authzId to another identity [RFC2829], it is desirable to request the server provide the authzId it associates with the assumed identity.
When a Proxied Authorization Control is be attached to the "Who Am I?" operation, the operation requests the return of the authzId the server associates with the identity asserted in the Proxied Authorization Control. The TBD result code is used to indicate that the server does not allow the client to assume the asserted identity. [[Note to RFC Editor: TBD is to be replaced with the name/code assigned by IANA for [PROXYAUTH] use.]]

5. Security Considerations

Identities associated with users may be sensitive information. When so, security layers [RFC2829][RFC2830] should be established to protect this information. This mechanism is specifically designed to allow security layers established by a Bind operation to protect the integrity and/or confidentiality of the authorization identity.

Servers may place access control or other restrictions upon the use of this operation. As stated in Section 3, the server SHOULD advertise this extension when it is willing and able to perform the operation.

As with any other extended operations, general LDAP security considerations [RFC3377] apply.

6. IANA Considerations

The OID 1.3.6.1.4.1.4203.1.11.3 is used to identify the LDAP "Who Am I?" extended operation. This OID was assigned [ASSIGN] by OpenLDAP Foundation, under its IANA-assigned private enterprise allocation [PRIVATE], for use in this specification.

Registration of this protocol mechanism [RFC3383] is requested.

Subject: Request for LDAP Protocol Mechanism Registration
Object Identifier: 1.3.6.1.4.1.4203.1.11.3
Description: Who am I?
Person & email address to contact for further information:
    Kurt Zeilenga <kurt@openldap.org>
Usage: Extended Operation
Specification: RFC XXXX

Comments: none

7. Acknowledgment

This document borrows from prior work in this area including...
"Authentication Response Control" [AUTHRESP] by Rob Weltman, Mark Smith and Mark Wahl.

The LDAP "Who am I?" operation takes its name from the UNIX whoami(1) command. The whoami(1) command displays the effective user id.
