A YANG Data Model for Client-layer Tunnel
draft-zheng-ccamp-client-tunnel-yang-04

Abstract

A transport network is a server-layer network to provide connectivity services to its client. In this draft the tunnel of client is described, with the definition of client tunnel YANG model.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 1, 2019.

1. Introduction

A transport network is a server-layer network designed to provide connectivity services for a client-layer network to carry the client traffic transparently across the server-layer network resources. The tunnel model in Traffic-Engineered network has been defined in both generic way and technology-specific way. The generic model, which is the base TE tunnel YANG model, can be found at [I-D.ietf-teas-yang-te]. Technology-specific models, such as OTN/ WSON tunnel model, have also been defined in [I-D.ietf-ccamp-otn-tunnel-model] and [I-D.ietf-ccamp-wson-tunnel-model] respectively. Corresponding tunnel on client-layer is also required, to have a complete topology view from the perspective of network controllers.

This document defines a data model of all client-layer tunnel, using YANG language defined in [RFC7950]. The model is augmenting the generic TE tunnel model, and can be used by applications exposing to a network controller via a REST interface. Furthermore, it can be used by an application to describe the client tunnel that constructed above the server-layer network. It is also worth noting that the
client layer network will only need the tunnel model when there is a demand for switching techniques, such as Carrier Ethernet and MPLS-TP. The transparent signals do not need this model.

2. Terminology and Notations

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in the YANG data tree presented later in this document is defined in [RFC8340]. They are provided below for reference.

- Brackets "[" and "]" enclose list keys.
- Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- Ellipsis ("...") stands for contents of subtrees that are not shown.

3. YANG Model for Client-layer Tunnel

3.1. YANG Tree for Ethernet Tunnel
Internet-Draft          Client Tunnel YANG Model           February 2019

module: ietf-eth-te-tunnel
  augment /te:te:tunnels/te:tunnel:
    +--rw src-eth-tunnel-endpoint
      |  +--rw vlanid?   etht-types:vlanid
      |  +--rw tag-type?  etht-types:eth-tag-type
    +--rw dst-eth-tunnel-endpoint
      |  +--rw vlanid?   etht-types:vlanid
      |  +--rw tag-type?  etht-types:eth-tag-type
    +--rw bandwidth-profile
      |  +--rw bandwidth-profile-name? string
      |  +--rw bandwidth-profile-type? etht-types:bandwidth-profile-type

  description
    "Destination ETH tunnel endpoint.";
  uses eth-tunnel-endpoint;
}

container bandwidth-profile {
  description
    "ETH tunnel bandwidth profile specification.";
  uses etht-types:etht-bandwidth-profiles;
}
}

<CODE ENDS>

4.2. Other Client-layer Tunnel YANG Code

TBD.

5. Considerations and Open Issue

Editor Notes: This section is used to note temporary discussion/ conclusion that to be fixed in the future version, and will be removed before publication. This is a part of L2 work, need to discuss how to go with other L2 network models. The expectation is to include all potential L2 TE part in this work.

6. IANA Considerations

TBD.

7. Manageability Considerations

TBD.

8. Security Considerations

The data following the model defined in this document is exchanged via, for example, the interface between an orchestrator and a
transport network controller. The security concerns mentioned in 
[I-D.ietf-teas-yang-te] also applies to this document.

The YANG module defined in this document can be accessed via the 
RESTCONF protocol defined in [RFC8040], or maybe via the NETCONF 
protocol [RFC6241].

9. Acknowledgements

We would like to thank Igor Bryskin and Daniel King for their 
comments and discussions.
