YANG Data Model for LSP-Ping
draft-zheng-mpls-lsp-ping-yang-cfg-10

Abstract

When an LSP fails to deliver user traffic, the failure cannot always be detected by the MPLS control plane. RFC 8029 defines a mechanism that would enable users to detect such failure and to isolate faults. YANG, defined in RFC 6020 and RFC 7950, is a data modeling language used to specify the contents of a conceptual data stores that allows networked devices to be managed using NETCONF, as specified in RFC 6241. This document defines a YANG data model that can be used to configure and manage LSP-Ping.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 13, 2019.

1. Introduction

When an LSP fails to deliver user traffic, the failure cannot always be detected by the MPLS control plane. [RFC8029] defines a mechanism that would enable users to detect such failure and to isolate faults. YANG, defined in [RFC6020] and [RFC7950], is a data modeling language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. This document defines a YANG data model that can be used to configure and manage LSP-Ping [RFC8029].
The rest of this document is organized as follows. Section 2 presents the scope of this document. Section 3 provides the design of the LSP-Ping configuration data model in details by containers. Section 4 presents the complete data hierarchy of LSP-Ping YANG model. Section 5 discusses the interaction between LSP-Ping data model and other MPLS tools data models. Section 6 specifies the YANG module and section 7 lists examples which conform to the YANG module specified in this document. Finally, security considerations are discussed in Section 8.

This version of the LSP Ping data model conforms to the Network Management Datastore Architecture (NMDA) [RFC8342].

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

1.2. Support of Long Running Command with NETCONF

LSP Ping is one of the examples of what can be described as "long-running operation". Unlike most of the configuration operations that result in single response execution of an LSP Ping triggers multiple responses from a node under control. The question of implementing the long-running operation in NETCONF is still open and possible solutions being discussed:

1. Consecutive Remote Processing Calls (RPC) to poll for results.
2. Model presented in [RFC4560].
3. The one outlined in [I-D.mahesh-netconf-persistent].

The problem of long-running operation as well can be considered as a case of controlling and obtaining results from a Measurement Agent (MA) as defined in [RFC7594].

2. Scope

The fundamental mechanism of LSP-Ping is defined in [RFC8029]. Extensions of LSP-Ping has been developed over the years. There are extensions for performing LSP ping, for example, over P2MP MPLS LSPs [RFC6425] or for Segment Routing IGP Prefix and Adjacency SIDs with an MPLS data plane [RFC8287]. These extensions will be considered in a later update of this document.
3. Design of the Data Model

This YANG data model is defined to be used to configure and manage LSP-Ping and it provides the following features:

1. The configuration of control information of an LSP-Ping test.
2. The configuration of schedule parameters of an LSP-Ping test.
3. Display of result information of an LSP-Ping test.

The top-level container lsp-pings holds the configuration of the control information, schedule parameters and result information for multiple instances of LSP-Ping test.

3.1. The Configuration of Control Information

Container lsp-pings:lsp-ping:control-parameters defines the configuration parameters which control an LSP-Ping test. Examples are the target-fec-type/target-fec of the echo request packet and the reply mode of the echo reply packet. Values of some parameters may be auto-assigned by the system, but in several cases, there is a requirement for configuration of these parameters. Examples of such parameters are source address and outgoing interface.

The data hierarchy for control information configuration is presented below:
module: ietf-lsp-ping
  +--rw lsp-pings
    +--rw lsp-ping* [lsp-ping-name]
      +--rw lsp-ping-name        string
      +--rw control-parameters
        +--rw target-fec-type?   target-fec-type
        +--rw (target-fec)?
          |  +--:(ip-prefix)
          |  |  +--rw ip-address?     inet:ip-address
          |  +--:(bgp)
          |  |  +--rw bgp?            inet:ip-address
          |  +--:(rsvp)
          |  |  +--rw tunnel-interface? string
          |  +--:(vpn)
          |  |  +--rw vrf-name?       uint32
          |  |  +--rw vpn-ip-address?  inet:ip-address
          |  +--:(pw)
          |  |  +--rw vcid?           uint32
          |  +--:(vpls)
          |     +--rw vsi-name?      string
          +--rw traffic-class?      uint8
        +--rw reply-mode?         reply-mode
        +--rw timeout?            uint32
        +--rw timeout-units?      units
        +--rw interval?           uint32
        +--rw interval-units?     units
        +--rw probe-count?        uint32
        +--rw data-size?          uint32
        +--rw data-fill?          string
        +--rw description?        string
        +--rw source-address?     inet:ip-address
        +--rw ttl?                uint8
        +--rw (outbound)?
          |  +--:(interface)
          |  |  +--rw interface-name? string
          |  +--:(nexthop)
          +--rw nexthop?           inet:ip-address

3.2.  The Configuration of Schedule Parameters

Container lsp-pings:lsp-ping:scheduling-parameters defines the schedule parameters of an LSP-Ping test, which describes when to start and when to end the test. Four start modes and three end modes are defined respectively. To be noted that, the configuration of "interval" and "probe-count" parameter defined in container lsp-pings:lsp-ping:control-parameters could also determine when the test ends implicitly. All these three parameters are optional. If the user
does not configure either "interval" or "probe-count" parameter, then the default values will be used by the system. If the user configures "end-test", then the actual end time of the LSP-Ping test is the smaller one between the configuration value of "end-test" and the time implicitly determined by the configuration value of "interval"/"probe-count".

The data hierarchy for schedule information configuration is presented below:

module: ietf-lsp-ping
  +--rw lsp-pings
    +--rw lsp-ping* [lsp-ping-name]
      +--rw lsp-ping-name string
      +--rw control-parameters
      ...
    +--rw scheduling-parameters
      +--rw (start-test)?
        | +--:(now)
        | | +--rw start-test-now? empty
        | +--:(at)
        | | +--rw start-test-at? yang:date-and-time
        | +--:(delay)
        | | +--rw start-test-delay? uint32
        | | +--rw start-test-delay-units? units
        | +--:(daily)
        | | +--rw start-test-daily? yang:date-and-time
      +--rw (end-test)?
        | +--:(at)
        | | +--rw end-test-at? yang:date-and-time
        | +--:(delay)
        | | +--rw end-test-delay? uint32
        | | +--rw end-test-delay-units? units
        | +--:(lifetime)
        | | +--rw end-test-lifetime? uint32
        | | +--rw lifetime-units? units

3.3. Display of Result Information

Container lsp-pings:lsp-ping:result-info shows the result of the current LSP-Ping test. Both the statistical result e.g. min-rtt, max-rtt, and per test probe result e.g. return code, return subcode, are shown.

The data hierarchy for display of result information is presented below:
4. Data Hierarchy

The complete data hierarchy of LSP-Ping YANG model is presented below.

    }
}
7. Examples

The following examples show the netconf RPC communication between client and server for one LSP-Ping test case.

7.1. Configuration of Control Information

Configure the control-parameters for sample-test-case.
Request from netconf client:
<rpc
message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<edit-config>
  <target>
    <running/>
  </target>
  <config>
    <lsp-pings xmlns="urn:ietf:params:xml:ns:yang:ietf-lsp-ping">
      <lsp-ping>
        <lsp-ping-name>sample-test-case</lsp-ping-name>
        <control-parameters>
          <target-fec-type>ip-prefix</target-fec-type>
          <ip-prefix>2001:db8::1:100/64</ip-prefix>
          <reply-mode>reply-via-udp</reply-mode>
          <timeout>1</timeout>
          <timeout-units>seconds</timeout-units>
          <interval>1</interval>
          <interval-units>seconds</interval-units>
          <probe-count>6</probe-count>
          <admin-status>enabled</admin-status>
          <data-size>64</data-size>
          <data-fill>this is a lsp ping test</data-fill>
          <source-address>2001:db8::4</source-address>
          <ttl>56</ttl>
        </control-parameters>
      </lsp-ping>
    </lsp-pings>
  </config>
</edit-config>
</rpc>

Reply from netconf server:
<rpc-reply
message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>

7.2. The Configuration of Schedule Parameters

Set the scheduling-parameters for sample-test-case to start the test.
Request from netconf client:
<rpc message-id="102" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <edit-config>
    <target>
      <running/>
    </target>
    <config>
      <lsp-pings xmlns="urn:ietf:params:xml:ns:yang:ietf-lsp-ping">
        <lsp-ping>
          <lsp-ping-name>sample-test-case</lsp-ping-name>
          <scheduling-parameters>
            <start-test-now/>
          </scheduling-parameters>
        </lsp-ping>
      </lsp-pings>
    </config>
  </edit-config>
</rpc>

Reply from netconf server:
<rpc-reply message-id="102" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>

7.3. Display of Result Information

Get the result-info of sample-test-case.

Request from netconf client:
<rpc message-id="103" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <get>
    <filter type="subtree">
      <lsp-pings xmlns="urn:ietf:params:xml:ns:yang:ietf-lsp-ping">
        <lsp-ping>
          <lsp-ping-name>sample-test-case</lsp-ping-name>
          <result-info/>
        </lsp-ping>
      </lsp-pings>
    </filter>
  </get>
</rpc>

Reply from netconf server:
<rpc-reply message-id="103" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>
<data>
  <lsp-pings xmlns="urn:ietf:params:xml:ns:yang:ietf-lsp-ping">
    <lsp-ping>
      <lsp-ping-name>sample-test-case</lsp-ping-name>
      <result-info>
        <operational-status>completed</operational-status>
        <source-address>2001:db8::4</source-address>
        <target-fec-type>ip-prefix</target-fec-type>
        <ip-prefix>2001:db8::1:100/64</ip-prefix>
        <min-rtt>10</min-rtt>
        <max-rtt>56</max-rtt>
        <average-rtt>36</average-rtt>
        <probe-responses>6</probe-responses>
        <sent-probes>6</sent-probes>
        <sum-of-squares>8882</sum-of-squares>
        <last-good-probe>2015-07-01T10:36:56</last-good-probe>
        <probe-results>
          <probe-result>
            <probe-index>0</probe-index>
            <return-code>0</return-code>
            <return-sub-code>3</return-sub-code>
            <rtt>10</rtt>
            <result-type>success</result-type>
          </probe-result>
          <probe-result>
            <probe-index>1</probe-index>
            <return-code>0</return-code>
            <return-sub-code>3</return-sub-code>
            <rtt>56</rtt>
            <result-type>success</result-type>
          </probe-result>
          <probe-result>
            <probe-index>2</probe-index>
            <return-code>0</return-code>
            <return-sub-code>3</return-sub-code>
            <rtt>35</rtt>
            <result-type>success</result-type>
          </probe-result>
          <probe-result>
            <probe-index>3</probe-index>
            <return-code>0</return-code>
            <return-sub-code>3</return-sub-code>
            <rtt>38</rtt>
            <result-type>success</result-type>
          </probe-result>
          <probe-result>
            <probe-index>4</probe-index>
            <return-code>0</return-code>
          </probe-result>
        </probe-results>
      </result-info>
    </lsp-ping>
  </lsp-pings>
</data>
8. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have an adverse effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

TBD

Unauthorized access to any data node of these subtrees can adversely affect the routing subsystem of both the local device and the network. This may lead to corruption of the measurement that may result in false corrective action, e.g., false negative or false positive. That could be, for example, prolonged and undetected
deterioration of the quality of service or actions to improve the quality unwarranted by the real network conditions.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

TBD

Unauthorized access to any data node of these subtrees can disclose the operational state information of VRRP on this device.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

TBD

The LSP ping YANG module inherits all security consideration of [RFC8029].

9. IANA Considerations

The IANA is requested to as assign a new namespace URI from the IETF XML registry.
