Yang data model for TACACS+
draft-zheng-opsawg-tacacs-yang-02

Abstract

This document defines a YANG modules that augment the System data model defined in the RFC 7317 with TACACS+ client model. The data model of Terminal Access Controller Access Control System Plus (TACACS+) client allows the configuration of TACACS+ servers for centralized Authentication, Authorization and Accounting.

The YANG modules in this document conforms to the Network Management Datastore Architecture (NMDA) defined in RFC 8342.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 22, 2019.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect

This document defines a YANG modules that augment the System data model defined in the [RFC7317] with TACACS+ client model.

TACACS+ provides Device Administration for routers, network access servers and other networked computing devices via one or more centralized servers which is defined in the TACACS+ Protocol.[I-D.ietf-opsawg-tacacs]

The System Management Model [RFC7317] defines two YANG features to support local or RADIUS authentication:

- **User Authentication Model**: Define a list of usernames and passwords and control the order in which local or RADIUS authentication is used.

- **RADIUS Client Model**: Defines a list of RADIUS server that a device used.

Since TACACS+ is also used for device management and the feature is not contained in the system model, this document defines a YANG data model that allows users to configure TACACS+ client functions on a device for centralized Authentication, Authorization and Accounting provided by TACACS+ servers.

---

1. Introduction

This document defines a YANG modules that augment the System data model defined in the [RFC7317] with TACACS+ client model.

TACACS+ provides Device Administration for routers, network access servers and other networked computing devices via one or more centralized servers which is defined in the TACACS+ Protocol. [I-D.ietf-opsawg-tacacs]

The System Management Model [RFC7317] defines two YANG features to support local or RADIUS authentication:

- **User Authentication Model**: Define a list of usernames and passwords and control the order in which local or RADIUS authentication is used.

- **RADIUS Client Model**: Defines a list of RADIUS server that a device used.

Since TACACS+ is also used for device management and the feature is not contained in the system model, this document defines a YANG data model that allows users to configure TACACS+ client functions on a device for centralized Authentication, Authorization and Accounting provided by TACACS+ servers.

---

The YANG models can be used with network management protocols such as NETCONF [RFC6241] to install, manipulate, and delete the configuration of network devices.

The YANG data model in this document conforms to the Network Management Datastore Architecture (NMDA) defined in [RFC8342].

2. Conventions used in this document

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP14, [RFC2119], [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [RFC6241] and are used in this specification:

- client
- configuration data
- server
- state data

The following terms are defined in [RFC7950] and are used in this specification:

- augment
- data model
- data node

The terminology for describing YANG data models is found in [RFC7950].

2.1. Tree Diagrams

Tree diagrams used in this document follow the notation defined in [RFC8340].

3. TACACS+ Client Model

This model is used to configure TACACS+ client on the device to support deployment scenarios with centralized authentication, authorization, and accounting servers. Authentication is used to
validates a user’s name and password, authorization allows the user to access and execute commands at various command levels assigned to the user and accounting keeps track of the activity of a user who has accessed the device.

The ietf-system-tacacsplus module is intended to augment the "/sys:system" path defined in the ietf-system module with "tacacsplus" grouping. Therefore, a device can use local, Remote Authentication Dial In User Service (RADIUS), or Terminal Access Controller Access Control System Plus (TACACS+) to validate users who attempt to access the router by several mechanisms, e.g. a command line interface or a web-based user interface.

The "server" list is directly under the "tacacsplus" container, which is to hold a list of different TACACS+ server and use server-type to distinguish the three protocols. The list of servers is for redundancy purpose.

Most of the parameters in the "server" list are taken directly from the TACACS+ protocol [I-D.ietf-opsawg-tacacs], and some are derived from the wide implementation of network equipment manufacturers. For example, when there are multiple interfaces connected to the TACACS+ server, the source address of outgoing TACACS+ packets could be specified, or the source address could be specified through the interface setting. For the TACACS+ server located in a private network, a VRF instance needs to be specified.

The "statistics" container under the "server list" is to record session statistics and usage information during user access which include the amount of data a user has sent and/or received during a session.

The data model for TACACS+ client has the following structure:
module: ietf-system-tacacsplus
augment /sys:system:
  +--rw tacacsplus {tacacsplus}?
    +--rw name              string
    +--rw server-type?      enumeration
    +--rw address           inet:host
    +--rw port?             inet:port-number
    +--rw shared-secret     string
    +--rw (source-type)?
      |   +--:(source-ip)
      |     +--rw source-ip? inet:ip-address
      |   +--:(source-interface)
      |     +--rw source-interface? if:interface-ref
    +--rw single-connection? boolean
    +--rw timeout?           uint16
    +--rw vrf-instance?
      -> /ni:network-instances/network-instance/name
    +--ro statistics
      +--ro connection-opens? yang:counter64
      +--ro connection-closes? yang:counter64
      +--ro connection-aborts? yang:counter64
      +--ro connection-failures? yang:counter64
      +--ro connection-timeouts? yang:counter64
      +--ro messages-sent?     yang:counter64
      +--ro messages-received? yang:counter64
      +--ro errors-received?   yang:counter64

}
5. Security Considerations

The YANG module defined in this document is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

This document describes the use of TACACS+ for purposes of authentication, authorization and accounting, it is vulnerable to all of the threats that are present in TACACS+ applications. For a discussion of such threats, see Section 9 of the TACACS+ Protocol [I-D.ietf-opsawg-tacacs].

6. IANA Considerations

This document registers a URI in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made:

- Registrant Contact: The IESG.
- XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [RFC7950].

- Name: ietf-system-tacacsplus
- Prefix: sys-tacsplus
- Reference: RFC XXXX
