1. Status of this Memo

This memo provides the initial version of the Management Information Base (MIB) for use with network management protocols in TCP/IP-based internets in the short-term. In particular, together with its companion memos which describe the structure of management information along with the initial network management protocol, these documents provide a simple, workable architecture and system for managing TCP/IP-based internets and in particular the Internet.
This memo specifies a draft standard for the Internet community. TCP/IP implementations in the Internet which are network manageable are expected to adopt and implement this specification.

Distribution of this memo is unlimited.

2. IAB POLICY STATEMENT

This MIB specification is the first edition of an evolving document defining variables needed for monitoring and control of various components of the Internet. Not all groups of defined variables are mandatory for all Internet components.

For example, the EGP group is mandatory for gateways using EGP but not for hosts which should not be running EGP. Similarly, the TCP group is mandatory for hosts running TCP but not for gateways which aren’t running it. What IS mandatory, however, is that all variables of a group be supported if any element of the group is supported.

It is expected that additional MIB groups and variables will be defined over time to accommodate the monitoring and control needs of new or changing components of the Internet. The MIB working group will continue to refine this specification and projects a revision incorporating new requirements in early 1989.

3. Introduction

As reported in RFC 1052, IAB Recommendations for the Development of Internet Network Management Standards [1], the Internet Activities Board has directed the Internet Engineering Task Force (IETF) to create two new working groups in the area of network management. One group is charged with the further specification and definition of elements to be included in the Management Information Base. The other is charged with defining the modifications to the Simple Network Management Protocol (SNMP) to accommodate the short-term needs of the network vendor and operator communities. The long-term needs of the Internet community are to be met using the ISO CMIS/CMIP [2,3] framework as a basis. An existing IETF working group, the "NETMAN" group, is already engaged in defining the use of CMIS/CMIP in a TCP/IP network, and will continue with responsibility for addressing the longer-term requirements.

The output of the MIB working group is to be provided to both the SNMP working group and the NETMAN group, so as to ensure compatibility of monitored items for both network management frameworks.

The MIB working group has produced this memo and a companion. The
companion memo [4] defines a Structure for Management Information
(SMI) for use by the managed objects contained in the MIB. This memo
defines the list of managed objects.

The IAB also urged the working groups to be "extremely sensitive to
the need to keep SNMP simple," and recommends that the MIB working
group take as its starting inputs the MIB definitions found in the
High-Level Entity Management Systems (HEMS) RFC 1024 [5], the initial
SNMP specification [6], and the CMIS/CMIP memos [7,8].

Thus, the list of managed objects defined here, has been derived by
taking only those elements which are considered essential. Since
such elements are essential, there is no need to allow the
implementation of individual objects, to be optional. Rather, all
compliant implementations will contain all applicable (see below)
objects defined in this memo.

This approach of taking only the essential objects is NOT
restrictive, since the SMI defined in the companion memo provides
three extensibility mechanisms: one, the addition of new standard
objects through the definitions of new versions of the MIB; two, the
addition of widely-available but non-standard objects through the
multilateral subtree; and three, the addition of private objects
through the enterprises subtree. Such additional objects can not only
be used for vendor-specific elements, but also for experimentation as
required to further the knowledge of which other objects are
essential.

The primary criterion for being considered essential was for an
object to be contained in all of the above referenced MIB
definitions. A few other objects have been included, but only if the
MIB working group believed they are truly essential. The detailed
list of criteria against which potential inclusions in this (initial)
MIB were considered, was:

1) An object needed to be essential for either fault or
configuration management.

2) Only weak control objects were permitted (by weak, it
is meant that tampering with them can do only limited
damage). This criterion reflects the fact that the
current management protocols are not sufficiently secure
to do more powerful control operations.

3) Evidence of current use and utility was required.

4) An attempt was made to limit the number of objects to
about 100 to make it easier for vendors to fully
instrument their software.

5) To avoid redundant variables, it was required that no object be included that can be derived from others in the MIB.

6) Implementation specific objects (e.g., for BSD UNIX) were excluded.

7) It was agreed to avoid heavily instrumenting critical sections of code. The general guideline was one counter per critical section per layer.
4. Objects

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using Abstract Syntax Notation One (ASN.1) [9].

The mechanisms used for describing these objects are specified in the companion memo. In particular, each object has a name, a syntax, and an encoding. The name is an object identifier, an administratively assigned name, which specifies an object type. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the OBJECT DESCRIPTOR, to also refer to the object type.

The syntax of an object type defines the abstract data structure corresponding to that object type. The ASN.1 language is used for this purpose. However, the companion memo purposely restricts the ASN.1 constructs which may be used. These restrictions are explicitly made for simplicity.

The encoding of an object type is simply how that object type is represented using the object type’s syntax. Implicitly tied to the notion of an object type’s syntax and encoding is how the object type is represented when being transmitted on the network. This memo specifies the use of the basic encoding rules of ASN.1 [10].

4.1. Object Groups

Since this list of managed objects contains only the essential elements, there is no need to allow individual objects to be optional. Rather, the objects are arranged into the following groups:

- System
- Interfaces
- Address Translation
- IP
- ICMP
- TCP
- UDP
- EGP

There are two reasons for defining these groups: one, to provide a means of assigning object identifiers; two, to provide a method for implementations of managed agents to know which objects they must implement. This method is as follows: if the semantics of a group is applicable to an implementation, then it must implement all objects
in that group. For example, an implementation must implement the EGP group if and only if it implements the EGP protocol.

4.2. Format of Definitions

The next section contains the specification of all object types contained in the MIB. Following the conventions of the companion memo, the object types are defined using the following fields:

OBJECT:
-------
A textual name, termed the OBJECT DESCRIPTOR, for the object type, along with its corresponding OBJECT IDENTIFIER.

Syntax:
The abstract syntax for the object type, presented using ASN.1. This must resolve to an instance of the ASN.1 type ObjectSyntax defined in the SMI.

Definition:
A textual description of the semantics of the object type. Implementations should ensure that their interpretation of the object type fulfills this definition since this MIB is intended for use in multi-vendor environments. As such it is vital that object types have consistent meaning across all machines.

Access:
One of read-only, read-write, write-only, or not-accessible.

Status:
One of mandatory, optional, or obsolete.
5. Object Definitions

RFC1066-MIB { iso org(3) dod(6) internet(1) mgmt(2) 1 }

DEFINITIONS ::= BEGIN

IMPORTS
    mgmt, OBJECT-TYPE, NetworkAddress, IpAddress,
    Counter, Gauge, TimeTicks
    FROM RFC1065-SMI;

mib OBJECT IDENTIFIER ::= { mgmt 1 }

system OBJECT IDENTIFIER ::= { mib 1 }
interfaces OBJECT IDENTIFIER ::= { mib 2 }
at OBJECT IDENTIFIER ::= { mib 3 }
ip OBJECT IDENTIFIER ::= { mib 4 }
icmp OBJECT IDENTIFIER ::= { mib 5 }
tcp OBJECT IDENTIFIER ::= { mib 6 }
tcp OBJECT IDENTIFIER ::= { mib 7 }
udp OBJECT IDENTIFIER ::= { mib 8 }

END
5.1. The System Group

Implementation of the System group is mandatory for all systems.

OBJECTION:
--------
  sysDescr { system 1 }

Syntax:
OCTET STRING

Definition:
A textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. It is mandatory that this only contain printable ASCII characters.

Access:
read-only.

Status:
mandatory.

OBJECTION:
--------
  sysObjectID { system 2 }

Syntax:
OBJECT IDENTIFIER

Definition:
The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining "what kind of box" is being managed. For example, if vendor "Flintstones, Inc." was assigned the subtree 1.3.6.1.4.1.42, it could assign the identifier 1.3.6.1.4.1.42.1.1 to its "Fred Router".

Access:
read-only.

Status:
mandatory.
OBJECT:
-------
  sysUpTime { system 3 }

Syntax:
  TimeTicks

Definition:
  The time (in hundredths of a second) since the network
  management portion of the system was last re-initialized.

Access:
  read-only.

Status:
  mandatory.
5.2. The Interfaces Group

Implementation of the Interfaces group is mandatory for all systems.

OBJECT:
--------
   ifNumber { interfaces 1 }

Syntax:
   INTEGER

Definition:
The number of network interfaces (regardless of their current state) on which this system can send/receive IP datagrams.

Access:
   read-only.

Status:
   mandatory.

5.2.1. The Interfaces Table

OBJECT:
--------
   ifTable { interfaces 2 }

Syntax:
   SEQUENCE OF IfEntry

Definition:
   A list of interface entries. The number of entries is given by the value of ifNumber.

Access:
   read-write.

Status:
   mandatory.

OBJECT:
--------
   ifEntry { ifTable 1 }

Syntax:
   IfEntry ::= SEQUENCE {

ifIndex
   INTEGER,
ifDescr
   OCTET STRING,
ifType
   INTEGER,
ifMtu
   INTEGER,
ifSpeed
   Gauge,
ifPhysAddress
   OCTET STRING,
ifAdminStatus
   INTEGER,
ifOperStatus
   INTEGER,
ifLastChange
   TimeTicks,
ifInOctets
   Counter,
ifInUcastPkts
   Counter,
ifInNUcastPkts
   Counter,
ifInDiscards
   Counter,
ifInErrors
   Counter,
ifInUnknownProtos
   Counter,
ifOutOctets
   Counter,
ifOutUcastPkts
   Counter,
ifOutNUcastPkts
   Counter,
ifOutDiscards
   Counter,
ifOutErrors
   Counter,
ifOutQLen
   Gauge
}

Definition:
   An interface entry containing objects at the subnetwork layer and below for a particular interface.
Access:
   read-write.

Status:
   mandatory.

We now consider the individual components of each interface entry:

OBJECT:
-------
   ifIndex { ifEntry 1 }

Syntax: INTEGER

Definition:
   A unique value for each interface. Its value ranges between 1 and the value of ifNumber. The value for each interface must remain constant at least from one re-initialization of the entity’s network management system to the next re-initialization.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------
   ifDescr { ifEntry 2 }

Syntax: OCTET STRING

Definition:
   A text string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the hardware interface. The string is intended for presentation to a human; it must not contain anything but printable ASCII characters.
Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
  ifType { ifEntry 3 }

Syntax:
  INTEGER {
    other(1),  -- none of the following
    regular1822(2),
    hdh1822(3),
    ddn-x25(4),
    rfc877-x25(5),
    ethernet-csmacd(6),
    iso88023-csmacd(7),
    iso88024-tokenBus(8),
    iso88025-tokenRing(9),
    iso88026-man(10),
    starLan(11),
    proteon-10MBit(12),
    proteon-80MBit(13),
    hyperchannel(14),
    fddi(15),
    lapb(16),
    sdlc(17),
    tl-carrier(18),
    cept(19),  -- european equivalent of T-1
    basicIsdn(20),
    primaryIsdn(21),
    -- proprietary serial
    propPointToPointSerial(22)
  }

Definition:
The type of interface, distinguished according to the
physical/link/network protocol(s) immediately "below" IP
in the protocol stack.

Access:
  read-only.

Status:
  mandatory.
OBJECT:  
-------
   ifMtu { ifEntry 4 }

Syntax:  
INTEGER

Definition:  
The size of the largest IP datagram which can be  
sent/received on the interface, specified in octets.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
-------
   ifSpeed { ifEntry 5 }

Syntax:  
Gauge

Definition:  
An estimate of the interface’s current bandwidth in bits  
per second. For interfaces which do not vary in  
bandwidth or for those where no accurate estimation can  
be made, this object should contain the nominal  
bandwidth.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
-------
   ifPhysAddress { ifEntry 6 }

Syntax:  
OCTET STRING

Definition:  
The interface’s address at the protocol layer immediately
"below" IP in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should contain an octet string of zero length.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ifAdminStatus { ifEntry 7 }

Syntax:
INTEGER {
    up(1),       -- ready to pass packets
down(2),
    testing(3)   -- in some test mode
}

Definition:
The desired state of the interface. The testing(3) state indicates that no operational packets can be passed.

Access:
read-write.

Status:
mandatory.

OBJECT:
-------
ifOperStatus { ifEntry 8 }

Syntax:
INTEGER {
    up(1),       -- ready to pass packets
down(2),
    testing(3)   -- in some test mode
}

Definition:
The current operational state of the interface. The testing(3) state indicates that no operational packets can be passed.
Access:
read-only.

Status:
mandatory.

OBJECT:
-------

ifLastChange { ifEntry 9 }

Syntax:
TimeTicks

Definition:
The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------

ifInOctets { ifEntry 10 }

Syntax:
Counter

Definition:
The total number of octets received on the interface, including framing characters.

Access:
read-only.

Status:
mandatory.
OBJECT:
-------
  ifInUcastPkts { ifEntry 11 }

Syntax:
Counter

Definition:
The number of (subnet) unicast packets delivered to a higher-layer protocol.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
  ifInNUcastPkts { ifEntry 12 }

Syntax:
Counter

Definition:
The number of non-unicast (i.e., subnet broadcast or subnet multicast) packets delivered to a higher-layer protocol.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
  ifInDiscards { ifEntry 13 }

Syntax:
Counter

Definition:
The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer
protocol. One possible reason for discarding such a packet could be to free up buffer space.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ifInErrors { ifEntry 14 }

Syntax:
Counter

Definition:
The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ifInUnknownProtos { ifEntry 15 }

Syntax:
Counter

Definition:
The number of packets received via the interface which were discarded because of an unknown or unsupported protocol.

Access:
read-only.

Status:
mandatory.
OBJECT:
-------
   ifOutOctets { ifEntry 16 }

Syntax:  
        Counter

Definition:  
The total number of octets transmitted out of the interface, including framing characters.

Access:
       read-only.

Status:
      mandatory.

OBJECT:
-------
   ifOutUcastPkts { ifEntry 17 }

Syntax:  
        Counter

Definition:  
The total number of packets that higher-level protocols requested be transmitted to a subnet-unicast address, including those that were discarded or not sent.

Access:
       read-only.

Status:
      mandatory.

OBJECT:
-------
   ifOutNUcastPkts { ifEntry 18 }

Syntax:  
        Counter

Definition:  
The total number of packets that higher-level protocols requested be transmitted to a non-unicast (i.e., a subnet broadcast or subnet multicast) address, including those...
that were discarded or not sent.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ifOutDiscards { ifEntry 19 }

Syntax:
Counter

Definition:
The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ifOutErrors { ifEntry 20 }

Syntax:
Counter

Definition:
The number of outbound packets that could not be transmitted because of errors.

Access:
read-only.

Status:
mandatory.
OBJECT:
------
    ifOutQLen { ifEntry 21 }

Syntax:
    Gauge

Definition:
    The length of the output packet queue (in packets).

Access:
    read-only.

Status:
    mandatory.
5.3. The Address Translation Group

Implementation of the Address Translation group is mandatory for all systems.

The Address Translation group contains one table which is the union across all interfaces of the translation tables for converting a NetworkAddress (e.g., an IP address) into a subnetwork-specific address. For lack of a better term, this document refers to such a subnetwork-specific address as a "physical" address.

Examples of such translation tables are: for broadcast media where ARP is in use, the translation table is equivalent to the ARP cache; or, on an X.25 network where non-algorithmic translation to X.121 addresses is required, the translation table contains the NetworkAddress to X.121 address equivalences.

OBJECT:
-------

atTable { at 1 }

Syntax:
SEQUENCE OF AtEntry

Definition:
The Address Translation tables contain the NetworkAddress to "physical" address equivalences. Some interfaces do not use translation tables for determining address equivalences (e.g., DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, i.e., has zero entries.

Access:
read-write.

Status:
mandatory.

OBJECT:
-------

atEntry { atTable 1 }

Syntax:
AtEntry ::= SEQUENCE {
atIfIndex

McCloghrie & Rose
INTEGER,
atPhysAddress
  OCTET STRING,
atNetAddress
    NetworkAddress
  
Definition:
  Each entry contains one NetworkAddress to "physical"
  address equivalence.

Access:
  read-write.

Status:
  mandatory.

We now consider the individual components of each Address
Translation table entry:

OBJECT:
------
  atIfIndex { atEntry 1 }

Syntax:
    INTEGER

Definition:
  The interface on which this entry’s equivalence is
  effective. The interface identified by a particular
  value of this index is the same interface as identified
  by the same value of ifIndex.

Access:
  read-write.

Status:
  mandatory.

OBJECT:
------
  atPhysAddress { atEntry 2 }

Syntax:
    OCTET STRING
Definition:
The media-dependent "physical" address.

Access:
read-write.

Status:
mandatory.

OBJECT:
-------
atNetAddress { atEntry 3 }

Syntax:
NetworkAddress

Definition:
The NetworkAddress (e.g., the IP address) corresponding to the media-dependent "physical" address.

Access:
read-write.

Status:
mandatory.
5.4. The IP Group

Implementation of the IP group is mandatory for all systems.

OBJECT:  
--------

   ipForwarding { ip 1 }

Syntax:

   INTEGER {
      gateway(1),   -- entity forwards datagrams
      host(2)       -- entity does NOT forward datagrams
   }

Definition:

   The indication of whether this entity is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this entity. IP gateways forward datagrams; Hosts do not (except those Source-Routed via the host).

Access:

   read-only.

Status:

   mandatory.

OBJECT:

--------

   ipDefaultTTL { ip 2 }

Syntax:

   INTEGER

Definition:

   The default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity, whenever a TTL value is not supplied by the transport layer protocol.

Access:

   read-write.

Status:

   mandatory.
OBJECT:
-------
    ipInReceives { ip 3 }

Syntax:
    Counter

Definition:
The total number of input datagrams received from interfaces, including those received in error.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
-------
    ipInHdrErrors { ip 4 }

Syntax:
    Counter

Definition:
The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
-------
    ipInAddrErrors { ip 5 }

Syntax:
    Counter

Definition:
The number of input datagrams discarded because the IP address in their IP header’s destination field was not a
valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ipForwDatagrams { ip 6 }

Syntax:
Counter

Definition:
The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ipInUnknownProtos { ip 7 }

Syntax:
Counter

Definition:
The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Access:
    read-only.

Status:
    mandatory.

OBJECT:
------
    ipInDiscards { ip 8 }

Syntax:
    Counter

Definition:
The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g. for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
------
    ipInDelivers { ip 9 }

Syntax:
    Counter

Definition:
The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).

Access:
    read-only.

Status:
    mandatory.

OBJECT:
------
    ipOutRequests { ip 10 }

McCloghrie & Rose
[Page 28]
Syntax:
   Counter

Definition:
The total number of IP datagrams which local IP user-
protocols (including ICMP) supplied to IP in requests for
transmission. Note that this counter does not include
any datagrams counted in ipForwDatagrams.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------
ipOutDiscards { ip 11 }

Syntax:
   Counter

Definition:
The number of output IP datagrams for which no problem
was encountered to prevent their transmission to their
destination, but which were discarded (e.g., for lack of
buffer space). Note that this counter would include
datagrams counted in ipForwDatagrams if any such packets
met this (discretionary) discard criterion.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------
ipOutNoRoutes { ip 12 }

Syntax:
   Counter
Definition:
The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwardedDatagrams which meet this "no-route" criterion.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
ipReasmTimeout { ip 13 }

Syntax:
INTEGER

Definition:
The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
ipReasmReqsds { ip 14 }

Syntax:
Counter

Definition:
The number of IP fragments received which needed to be reassembled at this entity.

Access:
read-only.

Status:
mandatory.
OBJECT:  
-------  
  ipReasmOKs { ip 15 }  

Syntax:  
Counter  

Definition:  
The number of IP datagrams successfully re-assembled.  

Access:  
read-only.  

Status:  
mandatory.  

OBJECT:  
-------  
  ipReasmFails { ip 16 }  

Syntax:  
Counter  

Definition:  
The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc).  

Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably RFC 815’s) can lose track of the number of fragments by combining them as they are received.  

Access:  
read-only.  

Status:  
mandatory.  

OBJECT:  
-------  
  ipFragOKs { ip 17 }  

Syntax:  
Counter
Definition:
The number of IP datagrams that have been successfully fragmented at this entity.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
   ipFragFails { ip 18 }

Syntax:
Counter

Definition:
The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their "Don’t Fragment" flag was set.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
   ipFragCreates { ip 19 }

Syntax:
Counter

Definition:
The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.

Access:
read-only.

Status:
mandatory.
5.4.1. The IP Address Table

The IP Address table contains this entity’s IP addressing information.

OBJECT:
-------
ipAddrTable { ip 20 }

Syntax:
SEQUENCE OF IpAddrEntry

Definition:
The table of addressing information relevant to this entity’s IP addresses.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
ipAddrEntry { ipAddrTable 1 }

Syntax:
IpAddrEntry ::= SEQUENCE {
ipAdEntAddr
    IpAddress,
ipAdEntIfIndex
    INTEGER,
ipAdEntNetMask
    IpAddress,
ipAdEntBcastAddr
    INTEGER
}

Definition:
The addressing information for one of this entity’s IP addresses.

Access:
read-only.
Status:
  mandatory.

OBJECT:
-------
  ipAdEntAddr  { ipAddrEntry 1 }

Syntax:
  IpAddress

Definition:
The IP address to which this entry’s addressing information pertains.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
  ipAdEntIfIndex  { ipAddrEntry 2 }

Syntax:
  INTEGER

Definition:
The index value which uniquely identifies the interface to which
this entry is applicable. The interface identified by a particular
value of this index is the same interface as identified by the same value
of ifIndex.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
  ipAdEntNetMask  { ipAddrEntry 3 }
Syntax:
   ipAddress

Definition:
The subnet mask associated with the IP address of this entry. The value of the mask is an IP address with all the network bits set to 1 and all the hosts bits set to 0.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------

ipAdEntBcastAddr { ipAddrEntry 4 }

Syntax:
   INTEGER

Definition:
The value of the least-significant bit in the IP broadcast address used for sending datagrams on the (logical) interface associated with the IP address of this entry. For example, when the Internet standard all-ones broadcast address is used, the value will be 1.

Access:
   read-only.

Status:
   mandatory.

5.4.2.  The IP Routing Table

The IP Routing Table contains an entry for each route presently known to this entity. Note that the action to be taken in response to a request to read a non-existent entry, is specific to the network management protocol being used.

OBJECT:
-------

ipRoutingTable { ip 21 }

McCloghrie & Rose

[Page 35]
Syntax:
SEQUENCE OF IpRouteEntry

Definition:
This entity’s IP Routing table.

Access:
read-write.

Status:
mandatory.

OBJECT:
-------

ipRouteEntry { ipRoutingTable 1 }

Syntax:
IpRouteEntry ::= SEQUENCE {
    ipRouteDest
        IpAddress,
    ipRouteIfIndex
        INTEGER,
    ipRouteMetric1
        INTEGER,
    ipRouteMetric2
        INTEGER,
    ipRouteMetric3
        INTEGER,
    ipRouteMetric4
        INTEGER,
    ipRouteNextHop
        IpAddress,
    ipRouteType
        INTEGER,
    ipRouteProto
        INTEGER,
    ipRouteAge
        INTEGER
}

Definition:
A route to a particular destination.

Access:
read-write.
We now consider the individual components of each route in the IP Routing Table:

OBJECT:
-------

ipRouteDest { ipRouteEntry 1 }  

Syntax: IpAddress  

Definition:  
The destination IP address of this route.  An entry with a value of 0.0.0.0 is considered a default route.  Multiple such default routes can appear in the table, but access to such multiple entries is dependent on the table-access mechanisms defined by the network management protocol in use.

Access:  
read-write.

Status:  
mandatory.

OBJECT:
-------

ipRouteIfIndex { ipRouteEntry 2 }  

Syntax: INTEGER  

Definition:  
The index value which uniquely identifies the local interface through which the next hop of this route should be reached.  The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.

Access:  
read-write.

Status:  
mandatory.
OBJECT:  
-------  
ipRouteMetric1 { ipRouteEntry 3 }  

Syntax:  
INTEGER  

Definition:  
The primary routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route’s ipRouteProto value. If this metric is not used, its value should be set to -1.  

Access:  
read-write.  

Status:  
mandatory.  

OBJECT:  
-------  
ipRouteMetric2 { ipRouteEntry 4 }  

Syntax:  
INTEGER  

Definition:  
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route’s ipRouteProto value. If this metric is not used, its value should be set to -1.  

Access:  
read-write.  

Status:  
mandatory.  

OBJECT:  
-------  
ipRouteMetric3 { ipRouteEntry 5 }  

Syntax:  
INTEGER
Definition:
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route’s ipRouteProto value. If this metric is not used, its value should be set to -1.

Access:
read-write.

Status:
mandatory.

OBJECT:
--------
ipRouteMetric4 { ipRouteEntry 6 }

Syntax:
INTEGER

Definition:
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route’s ipRouteProto value. If this metric is not used, its value should be set to -1.

Access:
read-write.

Status:
mandatory.

OBJECT:
--------
ipRouteNextHop { ipRouteEntry 7 }

Syntax:
IpAddress

Definition:
The IP address of the next hop of this route.

Access:
read-write.

Status:
mandatory.
OBJECT:  
-------
  ipRouteType { ipRouteEntry 8 }  

Syntax:
  INTEGER {
    other(1),         -- none of the following
    invalid(2),      -- an invalidated route
    direct(3),       -- route to directly
    remote(4),       -- route to a non-local
  }  

Definition:
  The type of route.

Access:
  read-write.

Status:
  mandatory.

OBJECT:  
-------
  ipRouteProto { ipRouteEntry 9 }

Syntax:
  INTEGER {
    other(1),         -- none of the following
    local(2),         -- entries
    netmgmt(3),       -- set via a network management protocol
    icmp(4),          -- e.g., Redirect
    egp(5),           -- all gateway routing protocols
  }  

Definition:
  Information about the route.

Access:
  read-write.

Status:
  mandatory.
Definition:
The routing mechanism via which this route was learned. Inclusion of values for gateway routing protocols is not intended to imply that hosts should support those protocols.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
ipRouteAge { ipRouteEntry 10 }

Syntax:
INTEGER

Definition:
The number of seconds since this route was last updated or otherwise determined to be correct. Note that no semantics of "too old" can be implied except through knowledge of the routing protocol by which the route was learned.

Access:
read-write.

Status:
mandatory.
5.5. The ICMP Group

Implementation of the ICMP group is mandatory for all systems.

The ICMP group contains the ICMP input and output statistics.

Note that individual counters for ICMP message (sub-)codes have been omitted from this (version of the) MIB for simplicity.

OBJECT:
-------

Object:
------

icmpInMsgs { icmp 1 }

Syntax:
Counter

Definition:
The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------

icmpInErrors { icmp 2 }

Syntax:
Counter

Definition:
The number of ICMP messages which the entity received but determined as having errors (bad ICMP checksums, bad length, etc.).

Access:
read-only.

Status:
mandatory.
OBJECT: icmpInDestUnreachs { icmp 3 }

Syntax: Counter

Definition: The number of ICMP Destination Unreachable messages received.

Access: read-only.

Status: mandatory.

OBJECT: icmpInTimeExcds { icmp 4 }

Syntax: Counter

Definition: The number of ICMP Time Exceeded messages received.

Access: read-only.

Status: mandatory.

OBJECT: icmpInParmProbs { icmp 5 }

Syntax: Counter

Definition: The number of ICMP Parameter Problem messages received.

Access: read-only.
Status:
    mandatory.

OBJECT:
------
    icmpInSrcQuenchs { icmp 6 }

Syntax:
    Counter

Definition:
    The number of ICMP Source Quench messages received.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
------
    icmpInRedirects { icmp 7 }

Syntax:
    Counter

Definition:
    The number of ICMP Redirect messages received.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
------
    icmpInEchos { icmp 8 }

Syntax:
    Counter

Definition:
    The number of ICMP Echo (request) messages received.
Access: 
    read-only.

Status: 
    mandatory.

OBJECT: 
-------
    icmpInEchoReps { icmp 9 }

Syntax: 
    Counter

Definition: 
    The number of ICMP Echo Reply messages received.

Access: 
    read-only.

Status: 
    mandatory.

OBJECT: 
-------
    icmpInTimestamps { icmp 10 }

Syntax: 
    Counter

Definition: 
    The number of ICMP Timestamp (request) messages received.

Access: 
    read-only.

Status: 
    mandatory.

OBJECT: 
-------
    icmpInTimestampReps { icmp 11 }

Syntax: 
    Counter
Definition:  
The number of ICMP Timestamp Reply messages received.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
--------  
icmpInAddrMasks { icmp 12 }

Syntax:  
Counter

Definition:  
The number of ICMP Address Mask Request messages received.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
--------  
icmpInAddrMaskReps { icmp 13 }

Syntax:  
Counter

Definition:  
The number of ICMP Address Mask Reply messages received.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
--------  
icmpOutMsgs { icmp 14 }
Syntax:
    Counter

Definition:
The total number of ICMP messages which this entity attempted to send. Note that this counter includes all those counted by icmpOutErrors.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
-------
    icmpOutErrors { icmp 15 }

Syntax:
    Counter

Definition:
The number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter’s value.

Access:
    read-only.

Status:
    mandatory.

OBJECT:
-------
    icmpDestUnreachs { icmp 16 }

Syntax:
    Counter

Definition:
The number of ICMP Destination Unreachable messages sent.
Access: read-only.

Status: mandatory.

OBJECT: 
-------
icmpOutTimeExcds { icmp 17 }

Syntax: Counter

Definition: The number of ICMP Time Exceeded messages sent.

Access: read-only.

Status: mandatory.

OBJECT: 
-------
icmpOutParmProbs { icmp 18 }

Syntax: Counter

Definition: The number of ICMP Parameter Problem messages sent.

Access: read-only.

Status: mandatory.

OBJECT: 
-------
icmpOutSrcQuenchs { icmp 19 }

Syntax: Counter
Definition:
The number of ICMP Source Quench messages sent.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
icmpOutRedirects { icmp 20 }

Syntax:
Counter

Definition:
The number of ICMP Redirect messages sent.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
icmpOutEchos { icmp 21 }

Syntax:
Counter

Definition:
The number of ICMP Echo (request) messages sent.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
icmpOutEchoReps { icmp 22 }
Syntax:
   Counter

Definition:
   The number of ICMP Echo Reply messages sent.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------
icmpOutTimestamps { icmp 23 }

Syntax:
   Counter

Definition:
   The number of ICMP Timestamp (request) messages sent.

Access:
   read-only.

Status:
   mandatory.

OBJECT:
-------
icmpOutTimestampReps { icmp 24 }

Syntax:
   Counter

Definition:
   The number of ICMP Timestamp Reply messages sent.

Access:
   read-only.

Status:
   mandatory.
OBJECT: icmpOutAddrMasks { icmp 25 }
Syntax:  Counter
Definition:  The number of ICMP Address Mask Request messages sent.
Access:  read-only.
Status:  mandatory.

OBJECT:  icmpOutAddrMaskReps { icmp 26 }
Syntax:  Counter
Definition:  The number of ICMP Address Mask Reply messages sent.
Access:  read-only.
Status:  mandatory.
5.6. The TCP Group

Implementation of the TCP group is mandatory for all systems that implement the TCP protocol.

Note that instances of object types that represent information about a particular TCP connection are transient; they persist only as long as the connection in question.

OBJECT:
-------
tcpRtoAlgorithm { tcp 1 }

Syntax:
INTEGR{E
  other(1), -- none of the following
  constant(2), -- a constant rto
  rsre(3), -- MIL-STD-1778, Appendix B
}

Definition:
The algorithm used to determine the timeout value used for retransmitting unacknowledged octets.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpRtoMin { tcp 2 }

Syntax:
INTEGER

Definition:
The minimum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type has the semantics of the LBOUND quantity described in RFC 793.
Access:  
read-only.

Status:  
mandatory.

OBJECT:  
--------

tcpRtoMax { tcp 3 }

Syntax:  
INTEGER

Definition:  
The maximum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type has the semantics of the UBOUND quantity described in RFC 793.

Access:  
read-only.

Status:  
mandatory.

OBJECT:  
--------

tcpMaxConn { tcp 4 }

Syntax:  
INTEGER

Definition:  
The limit on the total number of TCP connections the entity can support. In entities where the maximum number of connections is dynamic, this object should contain the value "-1".

Access:  
read-only.
Status:
  mandatory.

OBJECT:
-------
  tcpActiveOpens { tcp 5 }

Syntax:
  Counter

Definition:
The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
  tcpPassiveOpens { tcp 6 }

Syntax:
  Counter

Definition:
The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
  tcpAttemptFails { tcp 7 }

Syntax:
  Counter
Definition:
The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
tcpEstabResets { tcp 8 }

Syntax:
Counter

Definition:
The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.

Access:
read-only.

Status:
mandatory.

OBJECT:
--------
tcpCurrEstab { tcp 9 }

Syntax:
Gauge

Definition:
The number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT.

Access:
read-only.
Status:
  mandatory.

OBJECT:
-------
 tcpInSegs { tcp 10 }

Syntax:
  Counter

Definition:
  The total number of segments received, including those received in error. This count includes segments received on currently established connections.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
 tcpOutSegs { tcp 11 }

Syntax:
  Counter

Definition:
  The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------
 tcpRetransSegs { tcp 12 }

Syntax:
  Counter
Definition:
The total number of segments retransmitted - that is, the number of TCP segments transmitted containing one or more previously transmitted octets.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpConnTable { tcp 13 }

Syntax:
SEQUENCE OF TcpConnEntry

Definition:
A table containing TCP connection-specific information.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpConnEntry { tcpConnTable 1 }

Syntax:
TcpConnEntry ::= SEQUENCE {
tcpConnState
   INTEGER,
tcpConnLocalAddress
   IpAddress,
tcpConnLocalPort
   INTEGER (0..65535),
tcpConnRemAddress
   IpAddress,
tcpConnRemPort
   INTEGER (0..65535)
}
Definition:
  Information about a particular current TCP connection. An object of this type is transient, in that it ceases to exist when (or soon after) the connection makes the transition to the CLOSED state.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------

tcpConnState { tcpConnEntry 1 }

Syntax:
  INTEGER {
    closed(1),
    listen(2),
    synSent(3),
    synReceived(4),
    established(5),
    finWait1(6),
    finWait2(7),
    closeWait(8),
    lastAck(9),
    closing(10),
    timeWait(11)
  }

Definition:
  The state of this TCP connection.

Access:
  read-only.

Status:
  mandatory.

OBJECT:
-------

tcpConnLocalAddress { tcpConnEntry 2 }

Syntax:
  IpAddress
Definition:
The local IP address for this TCP connection.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpConnLocalPort { tcpConnEntry 3 }

Syntax:
INTEGER (0..65535)

Definition:
The local port number for this TCP connection.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpConnRemAddress { tcpConnEntry 4 }

Syntax:
IpAddress

Definition:
The remote IP address for this TCP connection.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
tcpConnRemPort { tcpConnEntry 5 }
Syntax:
   INTEGER (0..65535)

Definition:
   The remote port number for this TCP connection.

Access:
   read-only.

Status:
   mandatory.
5.7. The UDP Group

Implementation of the UDP group is mandatory for all systems which implement the UDP protocol.

OBJECT:
-------
udpInDatagrams { udp 1 }

Syntax:
Counter

Definition:
The total number of UDP datagrams delivered to UDP users.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
udpNoPorts { udp 2 }

Syntax:
Counter

Definition:
The total number of received UDP datagrams for which there was no application at the destination port.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------
udpInErrors { udp 3 }

Syntax:
Counter
Definition:
The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.

Access:
read-only.

Status:
mandatory.

OBJECT:
------
udpOutDatagrams { udp 4 }

Syntax:
Counter

Definition:
The total number of UDP datagrams sent from this entity.

Access:
read-only.

Status:
mandatory.
5.8. The EGP Group

Implementation of the EGP group is mandatory for all systems which implement the EGP protocol.

OBJECT:
-------

egpInMsgs { egp 1 }

Syntax:
Counter

Definition:
The number of EGP messages received without error.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------

egpInErrors { egp 2 }

Syntax:
Counter

Definition:
The number of EGP messages received that proved to be in error.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------

egpOutMsgs { egp 3 }

Syntax:
Counter
The total number of locally generated EGP messages.

Access:
read-only.

Status:
mandatory.

OBJECT:
-------

egpOutErrors { egp 4 }

Syntax:
Counter

Definition:
The number of locally generated EGP messages not sent
due to resource limitations within an EGP entity.

Access:
read-only.

Status:
mandatory.

5.8.1. The EGP Neighbor Table

The Egp Neighbor table contains information about this entity’s EGP neighbors.

OBJECT:
-------

egpNeighTable { egp 5 }

Syntax:
SEQUENCE OF EgpNeighEntry

Definition:
The EGP neighbor table.

Access:
read-only.

Status:
mandatory.
OBJECT:
-------
    egpNeighEntry { egpNeighTable 1 }

Syntax:
    EgpNeighEntry ::= SEQUENCE {
        egpNeighState
            INTEGER,
        egpNeighAddr
            IpAddress
    }

Definition:
    Information about this entity’s relationship with a particular EGP neighbor.

Access:
    read-only.

Status:
    mandatory.

We now consider the individual components of each EGP neighbor entry:

OBJECT:
-------
    egpNeighState { egpNeighEntry 1 }

Syntax:
    INTEGER {
        idle(1),
        acquisition(2),
        down(3),
        up(4),
        cease(5)
    }

Definition:
    The EGP state of the local system with respect to this entry’s EGP neighbor. Each EGP state is represented by a value that is one greater than the numerical value associated with said state in RFC 904.

Access:
    read-only.
Status:
  mandatory.

OBJECT:
--------
    egpNeighAddr { egpNeighEntry 2 }

Syntax:
    IpAddress

Definition:
    The IP address of this entry's EGP neighbor.

Access:
    read-only.

Status:
    mandatory.
6. Definitions

RFC1066-MIB { iso org(3) dod(6) internet(1) mgmt(2) 1 }

DEFINITIONS ::= BEGIN

7. Acknowledgements

The initial draft of this memo was heavily influenced by the HEMS [5] and SNMP [6] MIBs.

Its final form is the result of the suggestions, discussions, and the compromises reached by the members of the IETF MIB working group:

Karl Auerbach, Epilogue Technology
K. Ramesh Babu, Excelan
Lawrence Besaw, Hewlett-Packard
Jeffrey D. Case, University of Tennessee at Knoxville
James R. Davin, Proteon
Mark S. Fedor, NYSERNet
Robb Foster, BBN
Phill Gross, The MITRE Corporation
Bent Torp Jensen, Convergent Technology
Lee Labarre, The MITRE Corporation
Dan Lynch, Advanced Computing Environments
Keith McCloghrie, The Wollongong Group
Dave Mackie, 3Com/Bridge
Craig Partridge, BBN (chair)
Jim Robertson, 3Com/Bridge
Marshall T. Rose, The Wollongong Group
Greg Satz, cisco
Martin Lee Schoffstall, Rensselaer Polytechnic Institute
Lou Steinberg, IBM
Dean Throop, Data General
Unni Warrier, Unisys
