Definitions of Managed Objects
for the Border Gateway Protocol (Version 3)

Status of this Memo

This memo is an extension to the SNMP MIB. This RFC specifies an IAB standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "IAB Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP-based internets. In particular, it defines objects for managing the Border Gateway Protocol [11,12].

2. The Network Management Framework

The Internet-standard Network Management Framework consists of three components. They are:

RFC 1155 which defines the SMI, the mechanisms used for describing and naming objects for the purpose of management. RFC 1212 defines a more concise description mechanism, which is wholly consistent with the SMI.

RFC 1156 which defines MIB-I, the core set of managed objects for the Internet suite of protocols. RFC 1213, defines MIB-II, an evolution of MIB-I based on implementation experience and new operational requirements.

RFC 1157 which defines the SNMP, the protocol used for network access to managed objects.

The Framework permits new objects to be defined for the purpose of experimentation and evaluation.
3. Objects

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) [7] defined in the SMI. In particular, each object has a name, a syntax, and an encoding. The name is an object identifier, an administratively assigned name, which specifies an object type. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the OBJECT DESCRIPTOR, to also refer to the object type.

The syntax of an object type defines the abstract data structure corresponding to that object type. The ASN.1 language is used for this purpose. However, the SMI [3] purposely restricts the ASN.1 constructs which may be used. These restrictions are explicitly made for simplicity.

The encoding of an object type is simply how that object type is represented using the object type’s syntax. Implicitly tied to the notion of an object type’s syntax and encoding is how the object type is represented when being transmitted on the network.

The SMI specifies the use of the basic encoding rules of ASN.1 [8], subject to the additional requirements imposed by the SNMP.

3.1. Format of Definitions

Section 5 contains contains the specification of all object types contained in this MIB module. The object types are defined using the conventions defined in the SMI, as amended by the extensions specified in [9,10].

4. Overview

These objects are used to control and manage a BGP [11,12] implementation.

The Border Gateway Protocol (BGP) is an inter-Autonomous System routing protocol. The primary function of a BGP speaking system is to exchange network reachability information with other BGP systems. This network reachability information includes information on the full path of Autonomous Systems that traffic must transit to reach these networks.

BGP runs over a reliable transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission,
acknowledgement, and sequencing. Any authentication scheme used by
the transport protocol may be used in addition to BGP’s own
authentication mechanisms.

The planned use of BGP in the Internet environment, including such
issues as topology, the interaction between BGP and IGPs, and the
enforcement of routing policy rules is presented in a companion
document [12].

Apart from a few system variables, this MIB is broken into two
tables: the BGP Peer Table and the BGP Received Path Attribute Table.
The Peer Table reflects information about BGP peer connections, such
as their state and current activity. The Received Path Attribute
Table contains all attributes received from all peers before local
routing policy has been applied. The actual attributes used in
determining a route are a subset of the received attribute table.

5. Definitions

RFC1269-MIB DEFINITIONS ::= BEGIN

IMPORTS
    NetworkAddress, IpAddress, Counter
    FROM RFC1155-SMI
    mib-2
    FROM RFC1213-MIB
OBJECT-TYPE
    FROM RFC-1212
TRAP-TYPE
    FROM RFC-1215;

-- This MIB module uses the extended OBJECT-TYPE macro as
-- defined in [9], and the TRAP-TYPE macro as defined
-- in [10].

bgp     OBJECT IDENTIFIER ::= { mib-2 15 }

bgpVersion OBJECT-TYPE
SYNTAX OCTET STRING
ACCESS read-only
STATUS mandatory
DESCRIPTION
    "Vector of supported BGP protocol version
    numbers. Each peer negotiates the version from
    this vector. Versions are identified via the
    string of bits contained within this object.
    The first octet contains bits 0 to 7, the
    second octet contains bits 8 to 15, and so on,"
with the most significant bit referring to the lowest bit number in the octet (e.g., the MSB of the first octet refers to bit 0). If a bit, i, is present and set, then the version (i+1) of the BGP is supported.

```::= { bgp 1 }
```

```bgpLocalAs OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The local autonomous system number."
::= { bgp 2 }
```

```bgpPeerTable OBJECT-TYPE
SYNTAX SEQUENCE OF BgpPeerEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
"The bgp peer table."
::= { bgp 3 }
```

```bgpIdentifier OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The BGP Identifier of local system."
::= { bgp 4 }
```

```bgpPeerEntry OBJECT-TYPE
SYNTAX BgpPeerEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
"Information about a BGP peer connection."
INDEX
{ bgpPeerRemoteAddr }
::= { bgpPeerTable 1 }
```

```BgpPeerEntry ::= SEQUENCE {
  bgpPeerIdentifier
   IpAddress,
  bgpPeerState
   INTEGER, 
  bgpPeerAdminStatus
   INTEGER,
```
bgpPeerNegotiatedVersion
   INTEGER,
bgpPeerLocalAddr
   IpAddress,
bgpPeerLocalPort
   INTEGER,
bgpPeerRemoteAddr
   IpAddress,
bgpPeerRemotePort
   INTEGER,
bgpPeerRemoteAs
   INTEGER,
bgpPeerIn Updates
   Counter,
bgpPeerOut Updates
   Counter,
bgpPeerInTotal Messages
   Counter,
bgpPeerOutTotal Messages
   Counter,
bgpPeerLastError
   OCTET STRING
}

bgpPeerIdentifier OBJECT-TYPE
   SYNTAX IpAddress
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   "The BGP Identifier of this entry’s BGP peer."
   ::= { bgpPeerEntry 1 }

bgpPeerState OBJECT-TYPE
   SYNTAX INTEGER {
      idle(1),
      connect(2),
      active(3),
      opensent(4),
      openconfirm(5),
      established(6)
   }
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   "The bgp peer connection state."
   ::= { bgpPeerEntry 2 }
bgpPeerAdminStatus OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-write
STATUS mandatory
DESCRIPTION
"The desired state of the BGP connection. A transition from 'stop' to 'start' will cause the BGP Start Event to be generated. A transition from 'start' to 'stop' will cause the BGP Stop Event to be generated. This parameter can be used to restart BGP peer connections. Care should be used in providing write access to this object without adequate authentication."
::= { bgpPeerEntry 3 }

bgpPeerNegotiatedVersion OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The negotiated version of BGP running between the two peers."
::= { bgpPeerEntry 4 }

bgpPeerLocalAddr OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The local IP address of this entry’s BGP connection."
::= { bgpPeerEntry 5 }

bgpPeerLocalPort OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The local port for the TCP connection between the BGP peers."
::= { bgpPeerEntry 6 }

bgpPeerRemoteAddr OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The remote IP address of this entry’s BGP peer."
::= { bgpPeerEntry 7 }

bgpPeerRemotePort OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The remote port for the TCP connection between the BGP peers. Note that the objects bgpLocalAddr, bgpLocalPort, bgpRemoteAddr and bgpRemotePort provide the appropriate reference to the standard MIB TCP connection table."
::= { bgpPeerEntry 8 }

bgpPeerRemoteAs OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The remote autonomous system number."
::= { bgpPeerEntry 9 }

bgpPeerInUpdates OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The number of BGP UPDATE messages received on this connection. This object should be initialized to zero when the connection is established."
::= { bgpPeerEntry 10 }

bgpPeerOutUpdates OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The number of BGP UPDATE messages received on this connection. This object should be initialized to zero when the connection is established."
::= { bgpPeerEntry 11 }

bgpPeerInTotalMessages OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The total number of messages received from the remote peer on this connection. This object should be initialized to zero when the connection is established."
 ::= { bgpPeerEntry 12 }

bgpPeerOutTotalMessages OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The total number of messages transmitted to the remote peer on this connection. This object should be initialized to zero when the connection is established."
 ::= { bgpPeerEntry 13 }

bgpPeerLastError OBJECT-TYPE
SYNTAX OCTET STRING (SIZE (2))
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The last error code and subcode seen by this peer on this connection. If no error has occurred, this field is zero. Otherwise, the first byte of this two byte OCTET STRING contains the error code; the second contains the subcode."
 ::= { bgpPeerEntry 14 }

bgpRcvdPathAttrTable OBJECT-TYPE
SYNTAX SEQUENCE OF BgpPathAttrEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
"The BGP Received Path Attribute Table contains information about paths to destination networks received by all peers."
 ::= { bgp 5 }

bgpPathAttrEntry OBJECT-TYPE
SYNTAX BgpPathAttrEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
"Information about a path to a network."

INDEX
   { bgpPathAttrDestNetwork,
     bgpPathAttrPeer }
::= { bgpRcvdPathAttrTable 1 }

BgpPathAttrEntry ::= SEQUENCE {
   bgpPathAttrPeer     IpAddress,
   bgpPathAttrDestNetwork   IpAddress,
   bgpPathAttrOrigin      INTEGER,
   bgpPathAttrASPath      OCTET STRING,
   bgpPathAttrNextHop    IpAddress,
   bgpPathAttrInterASMetric INTEGER
}

bgpPathAttrPeer OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
   "The IP address of the peer where the path
    information
    was learned."
::= { bgpPathAttrEntry 1 }

bgpPathAttrDestNetwork OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
   "The address of the destination network."
::= { bgpPathAttrEntry 2 }

bgpPathAttrOrigin OBJECT-TYPE
SYNTAX INTEGER {
   igp(1),-- networks are interior
   egp(2),-- networks learned via EGP
   incomplete(3) -- undetermined
}
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The ultimate origin of the path information."
::= { bgpPathAttrEntry 3 }

bgpPathAttrASPath OBJECT-TYPE
SYNTAX OCTET STRING
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The set of ASs that must be traversed to reach the network. (This object is probably best represented as SEQUENCE OF INTEGER. For SMI compatibility, though, it is represented as OCTET STRING. Each AS is represented as a pair of octets according to the following algorithm:

first-byte-of-pair = ASNumber / 256;
second-byte-of-pair = ASNumber & 255;"
::= { bgpPathAttrEntry 4 }

bgpPathAttrNextHop OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The address of the border router that should be used for the destination network."
::= { bgpPathAttrEntry 5 }

bgpPathAttrInterASMetric OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
"The optional inter-AS metric. If this attribute has not been provided for this route, the value for this object is 0."
::= { bgpPathAttrEntry 6 }

bgpEstablished TRAP-TYPE
ENTERPRISE { bgp }
VARIABLES { bgpPeerRemoteAddr, bgpPeerLastError, bgpPeerState }
DESCRIPTION
"The BGP Established event is generated when the BGP FSM enters the ESTABLISHED state."
::= 1
bgpBackwardTransition TRAP-TYPE
ENTERPRISE { bgp }
VARIABLES { bgpPeerRemoteAddr,
            bgpPeerLastError,
            bgpPeerState }
DESCRIPTION
"The BGPBackwardTransition Event is generated
when the BGP FSM moves from a higher numbered
state to a lower numbered state."
 ::= 2

6. Acknowledgements

We would like to acknowledge the assistance of all the members of the
Interconnectivity Working Group, and particularly the following
individuals:

Yakov Rekhter, IBM
Rob Coltun, University of Maryland
Guy Almes, Rice University
Jeff Honig, Cornell Theory Center
Marshall T. Rose, PSI, Inc.
Dennis Ferguson, University of Toronto
Mike Mathis, PSC
