Definitions of Managed Objects
for Monitoring and Controlling the
UNI/NNI Multilink Frame Relay Function

Status of this Memo

This document specifies an Internet standards track protocol for the
Internet community, and requests discussion and suggestions for
improvements. Please refer to the current edition of the "Internet
Official Protocol Standards" (STD 1) for the standardization state
and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a Management Information Base (MIB) for monitoring
and controlling a UNI/NNI Multilink Frame Relay Function as defined
in Frame Relay Forum FRF.16. This MIB also includes conformance and
notification information.

1. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- An overall architecture, described in RFC 2571 [RFC2571].
- Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIv1 and described in STD 16, RFC 1155 [RFC1155], STD 16, RFC 1212 [RFC1212] and RFC 1215 [RFC1215]. The second version, called SMIv2, is described in STD 58: RFC 2578 [RFC2578], RFC 2579 [RFC2579] and RFC 2580 [RFC2580].
- Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [RFC1157]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [RFC1901] and RFC 1906 [RFC1906]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [RFC1906], RFC 2572 [RFC2572] and RFC 2574 [RFC2574].
Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [RFC1157]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [RFC1905].

A set of fundamental applications described in RFC 2573 [RFC2573] and the view-based access control mechanism described in RFC 2575 [RFC2575].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [RFC2570].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

2. Overview

This document defines a Management Information Base (MIB) for monitoring and controlling the UNI/NNI Multilink Frame Relay function. The agreement on which this MIB is based was defined and documented by the Frame Relay Forum in the Frame Relay Forum Document FRF.16 [FRF.16].

2.1. Multilink Frame Relay Background

Multilink Frame Relay (MFR) for the User-to-Network Interface (UNI) and the Network-to-Network Interface (NNI) provides physical interface emulation for frame relay devices. The emulated physical interface consists of one or more physical links, called "bundle links", aggregated together into a single "bundle" of bandwidth. This service provides a frame-based inverse multiplexing function, sometimes referred to as an "IMUX".
The bundle provides the same order-preserving service as a physical layer for frames sent on a data link connection. In addition, the bundle provides support for all Frame Relay services based on UNI and NNI standards.

2.1.1. Terminology

Physical Link -- A single physical interface that interconnects two devices in a frame relay network (e.g., DS1, DS0, Bearer channel, refer to FRF.14).

Bundle -- A grouping of one or more physical links using the formats and procedures of multilink frame relay. The bundle operates as a logical interface function that emulates a single physical interface to the Q.922 data link layer.

Bundle Link -- A MFR sub-component that controls operation of one of the bundle’s physical links.
2.1.2. Reference Model

Figure 1: MFR Reference Diagram

Note 1: C-Plane operation as described in Q.933 [Q.933] and FRF.4 [FRF.4]

Note 2: Multiple frame acknowledged information transfer mode as described in Q.922 [Q.922]

Note 3: Core aspects for use with frame relay bearer service as described in Q.922, Annex A [Q.922]

2.2. Structure of the MIB

The UNI/NNI MFR managed objects consist of two scalar objects and three tables.
2.2.1. mfrBundleMaxNumBundles

This scalar is used to inform the manager of the maximum number of bundles supported by this device.

2.2.2. mfrBundleNextIndex

This scalar is used to assist the manager in selecting a value for mfrBundleIndex during row creation. It can also be used to avoid race conditions with multiple managers trying to create rows in the table (see RFC 2494 [RFC2494] for one such algorithm).

2.2.3. mfrBundleTable

This table provides a means to configure and monitor bundles. It is indexed by mfrBundleIndex and contains these columns:

- mfrBundleIndex Integer32
- mfrBundleIfIndex InterfaceIndex
- mfrBundleRowStatus RowStatus
- mfrBundleNearEndName SnmpAdminString
- mfrBundleFragmentation INTEGER
- mfrBundleMaxFragSize Integer32
- mfrBundleTimerHello INTEGER
- mfrBundleTimerAck INTEGER
- mfrBundleCountMaxRetry INTEGER
- mfrBundleActivationClass INTEGER
- mfrBundleThreshold Integer32
- mfrBundleMaxDiffDelay Integer32
- mfrBundleSeqNumSize INTEGER
- mfrBundleLinksConfigured Integer32
- mfrBundleLinksActive Integer32
- mfrBundleBandwidth Integer32
- mfrBundleFarEndName SnmpAdminString
- mfrBundleResequencingErrors Counter32

2.2.4. Bundle-to-ifIndex Mapping Table

This table provides a means to take an ifIndex and find the corresponding mfrBundleIndex. It is indexed by ifIndex and contains these columns:

- mfrBundleIfIndexMapping Integer32

2.2.5. mfrBundleLinkTable

This table provides a means to configure and monitor bundle links. It is indexed by ifIndex and contains these columns:
2.3. Relationship With Other MIBS and Tables

2.3.1. Relationship With Interface Table

2.3.1.1. Bundle Links

Each bundle link will appear as an interface in the ifTable. The ifIndex that appears in the ifTable is used for indexing the bundle link tables in the UNI-NNI MFR MIB.

2.3.1.2. Bundles

Each bundle will appear as an interface in the ifTable. There will be corresponding mfrBundleIndex which may be different than the ifIndex of the bundle.

The reason is best summarized in RFC 2494 [RFC2494], which describes frame relay bundle of DS0. It says:

This table is not indexed by ifIndex because the manager has to choose the index in a createable row and the agent must be allowed to select ifIndex values.

The rows in the ifEntry table are not createable as they do not have row status. RFC 2863 [RFC2863] suggests that the ifIndex should be chosen by the agent. Here is its statement regarding row creation and deletion:

While some interfaces, for example, most physical interfaces, cannot be created via network management, other interfaces such as logical interfaces sometimes can be. The ifTable contains only generic information about an interface. Almost all ‘create-able’ interfaces have other, media-specific, information through which
configuration parameters may be supplied prior to creating such an
interface. Thus, the ifTable does not itself support the creation
or deletion of an interface (specifically, it has no RowStatus
column). Rather, if a particular interface type supports the
dynamic creation and/or deletion of an interface of that type,
then that media-specific MIB should include an appropriate
RowStatus object (see the ATM LAN-Emulation Client MIB [ATMLANE]
for an example of a MIB which does this). Typically, when such a
RowStatus object is created/deleted, then the conceptual row in
the ifTable appears/disappears as a by-product, and an ifIndex
value (chosen by the agent) is stored in an appropriate object in
the media-specific MIB.

The ATM LAN-Emulation Client MIB [ATMLANE] uses different indices and
so does the IMA MIB [ATMIMA]. Looking at the examples we have, and
the statements from RFC, it seems better to have two indices. This
gives the SNMP agent implementor the freedom to manage their ifIndex
in the way they like.

2.3.1.3. Mapping Between ifIndex and mfrBundleIndex

The mfrBundleIfIndexMappingTable is indexed by ifIndex and provides
the means to map a given ifIndex into the corresponding
mfrBundleIndex. The mfrBundleIfIndexMapping object in the
mfrBundleTable (indexed by mfrBundleIndex) provides the reverse
mapping of a mfrBundleIndex to the corresponding ifIndex in the
ifTable.

2.3.1.4. ifTable Objects

The bundle configuration and status table. There is a one-to-one
correspondence between a bundle and an interface represented in the
ifTable.

The following objects of the ifTable have specific meaning for an MFR
bundle:

- **ifAdminStatus**: the bundle admin status
- **ifOperStatus**: the bundle operational status
- **ifSpeed**: the current bandwidth of the bundle
- **ifInUcastPkts**: the number of frames received on the bundle
- **ifOutUcastPkts**: the number of frames transmitted on the bundle
- **ifInErrors**: frame (not fragment) errors
- **ifOutErrors**: frame (not fragment) errors

The following objects of the ifTable have specific meaning for an MFR
bundle link:
ifAdminStatus - the bundle link admin status
ifOperStatus - the bundle link operational status
ifSpeed - the bandwidth of the bundle link interface
ifInUcastPkts - the number of frames received on the bundle link
ifOutUcastPkts - the number of frames transmitted on the bundle link
ifInErrors - frame and fragment errors
ifOutErrors - frame and fragment errors

2.3.2. Relationship With Interface Stack Table

The bundles and bundle links will appear in the ifStackTable defined in RFC 2863 [RFC2863]. Each bundle link will appear a lower layer to its owner bundle. The bundle will appear as a higher layer to the bundle links and as a lower layer to a frame relay service or UNI.

2.3.3. Relationship With Frame Relay DTE MIB

The bundle will have a one-to-one correspondence with a DLCMI or UNI that appear in the DTE MIB tables [RFC2115].

2.3.4. Relationship With Frame Relay Service MIB

There is a one-to-one relationship between the MFR bundle and the frame relay service logical port defined in RFC1604 [RFC1604].

2.3.5. Example

Figure two shows an example of how the various tables are related. This example shows two bundles composed of 2 T1s each. The bundles have a mfrBundleIndex of 10 and 20 respectively.

```
+-------------------------+
|   Frame Relay Service   |
+-------------------------+

<p>| MFR Bundle | MFR Bundle |</p>
<table>
<thead>
<tr>
<th>10</th>
<th>20</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>T1</th>
<th>T1</th>
<th>T1</th>
<th>T1</th>
</tr>
</thead>
</table>
```

Figure 2: Frame Relay Service Being Carried on 4 T1s
The assignment of the ifTable index values could for example be:

<table>
<thead>
<tr>
<th>ifIndex</th>
<th>Description</th>
<th>ifType</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FrameRelayService</td>
<td>frameRelayService(44)</td>
</tr>
<tr>
<td>2</td>
<td>MFR Bundle #10</td>
<td>frf16MfrBundle(163)</td>
</tr>
<tr>
<td>3</td>
<td>MFR Bundle #20</td>
<td>frf16MfrBundle(163)</td>
</tr>
<tr>
<td>4</td>
<td>ds1 #1/MFR Bundle Link #1</td>
<td>ds1(18)</td>
</tr>
<tr>
<td>5</td>
<td>ds1 #2/MFR Bundle Link #2</td>
<td>ds1(18)</td>
</tr>
<tr>
<td>6</td>
<td>ds1 #3/MFR Bundle Link #3</td>
<td>ds1(18)</td>
</tr>
<tr>
<td>7</td>
<td>ds1 #4/MFR Bundle Link #4</td>
<td>ds1(18)</td>
</tr>
</tbody>
</table>

The ifStackTable is then used to show the relationships between the various interfaces.

<table>
<thead>
<tr>
<th>HigherLayer</th>
<th>LowerLayer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>2</td>
<td>5</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
</tr>
<tr>
<td>3</td>
<td>7</td>
</tr>
<tr>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>0</td>
</tr>
<tr>
<td>7</td>
<td>0</td>
</tr>
</tbody>
</table>

The mfrBundleIfIndexMappingTable shows the relationship between the ifTable ifIndex and the mfrBundleIndex:

<table>
<thead>
<tr>
<th>ifIndex</th>
<th>mfrBundleIfIndexMappingIndex</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>3</td>
<td>20</td>
</tr>
</tbody>
</table>

The mfrBundleTable shows the relationship between the mfrBundleIndex and the ifIndex:

<table>
<thead>
<tr>
<th>mfrBundleIndex</th>
<th>mfrBundleIfIndex</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>2</td>
</tr>
<tr>
<td>20</td>
<td>3</td>
</tr>
</tbody>
</table>
The mfrBundleLinkTable shows the relationship between the bundles and bundle links:

<table>
<thead>
<tr>
<th>mfrBundleIndex</th>
<th>mfrBundleLinkIfIndex</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4</td>
</tr>
<tr>
<td>10</td>
<td>5</td>
</tr>
<tr>
<td>20</td>
<td>6</td>
</tr>
<tr>
<td>20</td>
<td>7</td>
</tr>
</tbody>
</table>

2.4. Creation Of Bundles and Bundle Links

2.4.1. Creation Of Bundles

A new bundle is created by setting a createAndGo(4) value in the mfrBundleRowStatus RowStatus object. Optionally, an agent could also support setting a value of createAndWait(5) followed by a set to the value active(1).

When a bundle is created, the agent must create a new interface in the ifTable. The ifIndex for this new interface is used for the value of mfrBundleIfIndex.

2.4.2. Creation Of Bundle Links

A new bundle link is created by setting a createAndGo(4) value in the mfrBundleLinkRowStatus RowStatus object.

The bundle link is associated with a specific physical interface and uses the ifIndex of the physical interface. The mfrBundleLinkEntry row objects may be created after or during creation of the physical interface’s ifEntry row objects.

The bundle identified in the object mfrBundleIndex must exist at time of bundle link creation.

2.5. Notifications

The linkUp and linkDown traps are defined in RFC 2223 [RFC2223].

2.5.1. Bundle

The following SNMP traps are defined for MFR bundles.
2.5.1.1. linkUp

This trap is sent when the ifOperStatus of a bundle transitions from down to up. This occurs when a sufficient number of links (determined by mfrBundleActivationClass and mfrBundleThreshold) are in the operationally up state.

2.5.1.2. linkDown

This trap is sent when the ifOperStatus of a bundle transitions from up to down. This occurs when a insufficient number of links (determined by mfrBundleActivationClass and mfrBundleThreshold) are in the operationally up state.

2.5.2. Bundle Link

The following SNMP traps are defined for MFR bundle links.

2.5.2.1. linkUp

This trap is sent when a mfrBundleLinkState object transitions to the value mfrBundleLinkStateUp.

2.5.2.2. linkDown

This trap is sent when a mfrBundleLinkState object transitions from the value mfrBundleLinkStateUp.

2.5.2.3. mfrMibTrapBundleLinkMismatch

This trap indicates that a bundle link mismatch has been detected. The following objects are reported:

- mfrBundleNearEndName: configured name of near end bundle
- mfrBundleFarEndName: previously reported name of far end bundle
- mfrBundleLinkNearEndName: configured name of near end bundle
- mfrBundleLinkFarEndName: reported name of far end bundle
- mfrBundleLinkFarEndBundleName: currently reported name of far end bundle

Note that the configured items may have been configured automatically. Note also that the mfrBundleLinkMismatch counter is incremented when the trap is sent.
3. Object Definitions

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) defined in the SMI. In particular, each object type is named by an OBJECT IDENTIFIER, an administratively assigned name. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the descriptor, to refer to the object type.

DESCRIPTION
"The maximum delay difference between the bundle links."
A value of -1 indicates that this object does not contain a valid value.
DEFVAL { -1 }
::= { mfrBundleEntry 12 }

mfrBundleSeqNumSize OBJECT-TYPE
SYNTAX  INTEGER {
  seqNumSize12bit (1),
  seqNumSize24bit (2)
}
MAX-ACCESS  read-create
STATUS  current
DESCRIPTION
"Controls whether the standard FRF.12 12-bit sequence number is used or the optional 24-bit sequence number."
REFERENCE "FRFTC/99-194"
DEFVAL { seqNumSize12bit }
::= { mfrBundleEntry 13 }

mfrBundleMaxBundleLinks OBJECT-TYPE
SYNTAX  Integer32 (1..2147483647)
UNITS "Bundle Links"
MAX-ACCESS  read-only
STATUS  current
DESCRIPTION
"The maximum number of bundle links supported for this bundle."
::= { mfrBundleEntry 14 }

mfrBundleLinksConfigured OBJECT-TYPE
SYNTAX  Integer32 (1..2147483647)
UNITS "Bundle Links"
MAX-ACCESS  read-only
STATUS  current
DESCRIPTION
"The number of links configured for the bundle."
::= { mfrBundleEntry 15 }

mfrBundleLinksActive OBJECT-TYPE
SYNTAX  Integer32 (-1..2147483647)
UNITS "Bundle Links"
MAX-ACCESS  read-only
STATUS  current
DESCRIPTION
"The number of links that are active."
::= { mfrBundleEntry 16 }
mfrBundleBandwidth OBJECT-TYPE
SYNTAX  Integer32
UNITS "Bits/Sec"
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The amount of available bandwidth on the bundle"
::= { mfrBundleEntry 17 }

mfrBundleFarEndName OBJECT-TYPE
SYNTAX  SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"Name of the bundle received from the far end."
REFERENCE "FRF.16 section 3.4.1"
::= { mfrBundleEntry 18 }

mfrBundleResequencingErrors OBJECT-TYPE
SYNTAX  Counter32
UNITS "Error Events"
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"A count of the number of resequencing errors. Each event may correspond to multiple lost frames. Example:
Say sequence number 56, 59 and 60 is received for DLCI 100. It is decided by some means that sequence 57 and 58 is lost. This counter should then be incremented by ONE, even though two frames were lost."
::= { mfrBundleEntry 19 }

-- ---------------------------------------------------------
-- ---------------------------------------------------------
-- ifIndex Mapping to Bundle Index Table
-- ---------------------------------------------------------
-- ---------------------------------------------------------

mfrBundleIfIndexMappingTable OBJECT-TYPE
SYNTAX  SEQUENCE OF MfrBundleIfIndexMappingEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A table mapping the values of ifIndex to the mfrBundleIndex. This is required in order to find the mfrBundleIndex given an ifIndex. The mapping of mfrBundleIndex to ifIndex is provided by the mfrBundleIfIndex entry in the mfrBundleTable."
mfrBundleIfIndexMappingEntry OBJECT-TYPE
SYNTAX MfrBundleIfIndexMappingEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"Each row describes one ifIndex to mfrBundleIndex mapping."
INDEX  { ifIndex }
 ::= { mfrBundleIfIndexMappingTable 1 }

MfrBundleIfIndexMappingEntry ::= SEQUENCE {
   mfrBundleIfIndexMappingIndex Integer32
}

mfrBundleIfIndexMappingIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The mfrBundleIndex of the given ifIndex."
 ::= { mfrBundleIfIndexMappingEntry 2 }

mfrBundleLinkTable OBJECT-TYPE
SYNTAX SEQUENCE OF MfrBundleLinkEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"The bundle link configuration and status table. There is a one-to-one correspondence between a bundle link and a physical interface represented in the ifTable. The ifIndex of the physical interface is used to index the bundle link table, and to create rows."

The following objects of the ifTable have specific meaning for an MFR bundle link:

ifAdminStatus  - the bundle link admin status
ifOperStatus   - the bundle link operational status
ifSpeed        - the bandwidth of the bundle
                 link interface
ifInUcastPkts  - the number of frames received
                 on the bundle link
ifOutUcastPkts - the number of frames transmitted
                 on the bundle link
ifInErrors     - frame and fragment errors
ifOutErrors    - frame and fragment errors

::= { mfrMibBundleLinkObjects 1 }

6. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

No managed objects in this MIB contain sensitive information.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model RFC 2574 [RFC2574] and the View-based Access Control Model RFC 2575 [RFC2575] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
