A YANG Data Model for Layer 3 Topologies

Abstract

This document defines a YANG data model for Layer 3 network topologies.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc8346.

1.  Introduction

This document introduces a YANG [RFC7950] [RFC6991] data model for Layer 3 (L3) network topologies, specifically Layer 3 Unicast. The model allows an application to have a holistic view of the topology of a Layer 3 network, all contained in a single conceptual YANG datastore. The data model builds on top of, and augments, the data model for network topologies defined in [RFC8345].

This document also shows how the model can be further refined to cover different Layer 3 Unicast topology types. For this purpose, an example model is introduced that covers OSPF [RFC2328]. This example is intended purely for illustrative purpose; we expect that a complete OSPF model will be more comprehensive and refined than the example shown in this document.

There are multiple applications for a topology data model. A number of use cases have been defined in Section 6 of [USECASE-REQS]. For example, nodes within the network can use the data model to capture their understanding of the overall network topology and expose it to a network controller. A network controller can then use the instantiated topology data to compare and reconcile its own view of the network topology with that of the network elements that it controls. Alternatively, nodes within the network could propagate this understanding to compare and reconcile this understanding either amongst themselves or with help of a controller. Beyond the network element itself, a network controller might even use the data model to represent its view of the topology that it controls and expose it to applications north of itself.

The data model for Layer 3 Unicast topologies defined in this document is specified in the YANG module "ietf-l3-unicast-topology". This YANG module augments the general network topology model defined in [RFC8345] with information specific to Layer 3 Unicast. In this way, the general topology model is extended to be able to meet the needs of Layer 3 Unicast topologies.

Information that is kept in the Traffic Engineering Database (TED) will be specified in a separate model [YANG-TE] and is outside the scope of this specification.

2.  Key Words

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.
3. Definitions and Acronyms

This document defines a YANG data model and thus uses many terms defined in YANG [RFC7950] and NETCONF [RFC6241]. Some terms, such as "datastore" and "data tree", are repeated here for clarity and context.

Datastore: A conceptual place to store and access information. A datastore might be implemented, for example, using files, a database, flash memory locations, or combinations thereof. A datastore maps to an instantiated YANG data tree (definition adopted from [RFC8342]).

Data subtree: An instantiated data node and the data nodes that are hierarchically contained within it.

IS-IS: Intermediate System to Intermediate System protocol

LSP: Label Switched Path

NETCONF: Network Configuration Protocol

NMDA: Network Management Datastore Architecture

OSPF: Open Shortest Path First (a link-state routing protocol)

URI: Uniform Resource Identifier

TED: Traffic Engineering Database

YANG: YANG is a data modeling language used to model configuration data, state data, Remote Procedure Calls, and notifications for network management protocols [RFC7950].
4. Model Structure

The Layer 3 Unicast topology model is defined by YANG module "l3-unicast-topology". The relationship of this module with other YANG modules is roughly depicted in the figure below.

```
+-----------------------------+  |
|  +-----------------------+  |
|  |      ietf-network     |  |
|  +----------^------------+  |
|  |             |               |
|  +-----------------------+  |
|  | ietf-network-topology |  |
|  +----------+------------+  |
|  +-------------^---------------+  |
+-------------|---------------|
|              |

|  | ietf-l3-unicast-topology |  |
|  +----------^-------------+  |
|  |             |               |
|  +-----------------------+  |
|  | example-ospf-topology |  |
|  +-----------------------+
```

Figure 1: Overall Model Structure

YANG modules "ietf-network" and "ietf-network-topology" collectively define the basic network topology model [RFC8345]. YANG module "ietf-l3-unicast-topology" augments those models with additional definitions needed to represent Layer 3 Unicast topologies. This module in turn can be augmented by YANG modules with additional definitions for specific types of Layer 3 Unicast topologies, such as OSPF and IS-IS topologies.

The YANG modules "ietf-network" and "ietf-network-topology" are designed to be used in conjunction with implementations that support the Network Management Datastore Architecture (NMDA) defined in [RFC8342]. Accordingly, the same is true for the YANG modules that augment it. In order to allow implementations to use the model even in cases when NMDA is not supported, companion YANG modules (that SHOULD NOT be supported by implementations that support NMDA) are defined in Appendix A.
5. Layer 3 Unicast Topology Model Overview

The Layer 3 Unicast topology model is defined by YANG module "ietf-l3-unicast-topology". Its structure is depicted in the following diagram. The notation syntax follows [RFC8340]. For purposes of brevity, notifications are not depicted.

```
module: ietf-l3-unicast-topology
  augment /nw:networks/nw:network/nw:network-types:
    +--rw l3-unicast-topology!
  augment /nw:networks/nw:network:
    +--rw l3-topology-attributes
      +--rw name?   string
      +--rw flag*   l3-flag-type
  augment /nw:networks/nw:network/nw:node:
    +--rw l3-node-attributes
      +--rw name?        inet:domain-name
      +--rw flag*        node-flag-type
      +--rw router-id*   rt-types:router-id
      +--rw prefix* [prefix]
        +--rw prefix    inet:ip-prefix
        +--rw metric?   uint32
        +--rw flag*     prefix-flag-type
  augment /nw:networks/nw:network/nt:link:
    +--rw l3-link-attributes
      +--rw name?      string
      +--rw flag*      link-flag-type
      +--rw metric1?   uint64
      +--rw metric2?   uint64
  augment /nw:networks/nw:network/nw:node/nt:termination-point:
    +--rw l3-termination-point-attributes
      +--rw (termination-point-type)?
        +--:(ip)
          | +--rw ip-address*   inet:ip-address
        +--:(unnumbered)
          | +--rw unnumbered-id? uint32
          +--:(interface-name)
            +--rw interface-name? string
```

The module augments the original "ietf-network" and "ietf-network-topology" modules as follows:

- A new network topology type is introduced, l3-unicast-topology. The corresponding container augments the network-types of the "ietf-network" module.
o Additional topology attributes are introduced, defined in a
grouping that augments the "network" list of the network module.
The attributes include a name for the topology and a set of flags
(represented by a leaf-list). Each type of flag is represented by
a separate identity. This allows additional flags to be
introduced in augmenting modules using additional identities
without needing to revise this module.

o Additional data objects for nodes are introduced by augmenting the
"node" list of the network module. New objects include a set of
flags and a list of prefixes. Each prefix includes an IP prefix,
a metric, and a prefix-specific set of flags.

o Links (in the "ietf-network-topology" module) are augmented with a
set of parameters that allow a link to be associated with a link
name, another set of flags, and a link metric.

o Termination points (in the "ietf-network-topology" module) are
augmented with a choice of IP address, identifier, or name.

In addition, the module defines a set of notifications to alert
clients of any events concerning links, nodes, prefixes, and
termination points. Each notification includes an indication of the
type of event, the topology from which it originated, and the
affected node, link, prefix, or termination point. Also, as a
convenience to applications, additional data of the affected node,
link, prefix, or termination point is included. While this makes
notifications larger in volume than they need to be, it avoids the
need for subsequent retrieval of context information that might have
changed in the meantime.

6. Layer 3 Unicast Topology YANG Module

This YANG module makes reference to the following documents:

7. Interactions with Other YANG Modules

As described in Section 4, the model defined in this document builds on top of, and augments, the YANG modules defined in [RFC8345]. Specifically, the "ietf-l3-unicast-topology" module augments the "ietf-network" and "ietf-network-topology" modules. In addition, the model makes use of data types defined in [RFC6991].

The model defined in this document is a protocol-independent YANG data model with Layer 3 topology information. It is separate from and not linked with data models that are used to configure routing protocols or routing information, e.g., "ietf-routing" [RFC8022] and "ietf-rib-extension" [YANG-RIB]. That said, the model does import a type definition from model "ietf-routing-types" [RFC8294].

The model complies with the requirements for the ephemeral state found in [RFC8242]. For ephemeral topology data that is server provided, the process tasked with maintaining topology information will load information from the routing process (such as OSPF) into the data model without relying on a configuration datastore.

8. IANA Considerations

This document registers the following namespace URIs in the "IETF XML Registry" [RFC3688]:

Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.
This document registers the following YANG modules in the "YANG Module Names" registry [RFC6020]:

Name: ietf-l3-unicast-topology
Prefix: l3t
Reference: RFC 8346

Name: ietf-l3-unicast-topology-state
Prefix: l3t-s
Reference: RFC 8346

9. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

In general, Layer 3 Unicast topologies are system-controlled and provide ephemeral topology information. In an NMDA-compliant server, they are only part of <operational>, which provides read-only access to clients, so they are less vulnerable. That said, the YANG modules do in principle allow information to be configurable.

There are a number of data nodes defined in these YANG modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability in the "ietf-l3-unicast-topology" module:

- l3-topology-attributes: A malicious client could attempt to sabotage the configuration of any of the contained attributes, i.e., the name or the flag data nodes.
o l3-node-attributes: A malicious client could attempt to sabotage the configuration of important node attributes, such as the router-id or node prefix.

o l3-link-attributes: A malicious client could attempt to sabotage the configuration of important link attributes, such as name, flag, and metrics of the link.

o l3-termination-point-attributes: A malicious client could attempt to sabotage the configuration information of a termination point, such as the termination point’s IP address and interface name.

Appendix A.  Companion YANG Data Model for Implementations Not Compliant with NMDA

The YANG module "ietf-l3-unicast-topology" defined in this document augments two modules defined in [RFC8345]: "ietf-network" and "ietf-network-topology". These two modules were designed to be used in conjunction with implementations that support the Network Management Datastore Architecture (NMDA) defined in [RFC8342]. In order to allow implementations to use the model in cases when NMDA is not supported, [RFC8345] defines two companion modules, "ietf-network-state" and "ietf-network-topology-state", that represent state models of networks and network topologies, respectively.

In order to be able to use the model for Layer 3 topologies defined in this document in conjunction with implementations not compliant with NMDA, a corresponding companion module needs to be introduced as well. This companion module, "ietf-l3-unicast-topology-state", mirrors "ietf-l3-unicast-topology". However, the module augments "ietf-network-state" and "ietf-network-topology-state" (instead of "ietf-network" and "ietf-network-topology"), and all of its data nodes are non-configurable.

Similar considerations apply to any module that augments "ietf-l3-unicast-topology", such as the example module defined in Appendix B (i.e., example-ospf-topology). For implementations that are not compliant with NMDA, companion modules that represent state information and that are non-configurable will need to be introduced. These modules augment "ietf-l3-unicast-topology-state" instead of "ietf-l3-unicast-topology". Companion modules for the example module defined in Appendix B are not provided (since it is just an example).

Like "ietf-network-state" and "ietf-network-topology-state", "ietf-l3-unicast-topology" SHOULD NOT be supported by implementations that support NMDA. The module is therefore defined in an appendix.

The definition of the module follows below. As the structure of the module mirrors that of its underlying module, the YANG tree is not depicted separately.

description
    "This module defines a model for Layer 3 Unicast topology state, representing topology that either is learned or results from applying topology that has been configured per the 'ietf-l3-unicast-topology' model, mirroring the corresponding data nodes in this model.

    This model mirrors 'ietf-l3-unicast-topology' but contains only read-only state data. The model is not needed when the underlying implementation infrastructure supports the Network Management Datastore Architecture (NMDA).

Appendix B. Extending the Model

The model can be extended for specific Layer 3 Unicast types. Examples include OSPF and IS-IS topologies. This appendix introduces a YANG module that defines a simple topology model for OSPF. This module is intended to serve as an example that illustrates how the general topology model can be refined across multiple levels. It does not constitute a full-fledged OSPF topology model, which may be more comprehensive and refined than the model that is described here.

B.1. Example OSPF Topology

B.1.1. Model Overview

The following model shows how the Layer 3 Unicast topology model can be extended, in this case, to cover OSPF topologies. For this purpose, a set of augmentations are introduced in a separate YANG module, "example-ospf-topology", whose structure is depicted in the following diagram. As before, the notation syntax follows [RFC8340]. Note that one of the lines has been wrapped to adhere to the 72-character line limitation of RFCs.
The module augments "ietf-l3-unicast-topology" as follows:

- A new topology type for an OSPF topology is introduced.
- Additional topology attributes are defined in a new grouping that augments 13-topology-attributes of the "ietf-l3-unicast-topology" module. The attributes include an OSPF area-id identifying the OSPF area.
Additional data objects for nodes are introduced by augmenting the l3-node-attributes of the "ietf-l3-unicast-topology" module. New objects include router-type and dr-interface-id for pseudonodes.

Links are augmented with OSPF link attributes.

In addition, the module extends notifications for events concerning Layer 3 nodes and links with OSPF attributes.

It should be noted that the model defined here represents topology and is intended as an example. It does not define how to configure OSPF routers or interfaces.

B.1.2. OSPF Topology YANG Module

The OSPF Topology YANG module is specified below. As mentioned, the module is intended as an example for how the Layer 3 Unicast topology model can be extended to cover OSPF topologies, but it is not normative. Accordingly, the module is not delimited with <CODE BEGINS> and <CODE ENDS> tags.

```yang
file "example-ospf-topology@2017-12-16.yang"
module example-ospf-topology {
  yang-version 1.1;
  namespace "urn:example:example-ospf-topology";
  prefix "ex-ospft";
  import ietf-yang-types {
    prefix "yang";
  }
  import ietf-network {
    prefix "nw";
  }
  import ietf-network-topology {
    prefix "nt";
  }
  import ietf-l3-unicast-topology {
    prefix "l3t";
  }
  description
    "This module is intended as an example for how the Layer 3 Unicast topology model can be extended to cover OSPF topologies.";
  typedef area-id-type {
    type yang:dotted-quad;
    description
      "Area ID type.";
  }
  grouping ospf-topology-type {
  }
```
augment "*/nw:networks/nw:network/nw:network-types/*
+ "l3t:l3-unicast-topology" {
    when "../nw:network-types/l3t:l3-unicast-topology/"
    uses ospf-topology-type;
}

augment "*/nw:networks/nw:network/l3t:l3-topology-attributes" {
    when "./nw:network-types/l3t:l3-unicast-topology/"
    uses ospf-node-attributes;
}

augment "*/nw:networks/nw:network/nt:link/l3t:l3-link-attributes" {
    when "./nw:network-types/l3t:l3-unicast-topology/"
    uses ospf-link-attributes;
}
description
"Augments link configuration";
uses ospf-link-attributes;
}
grouping ospf-node-attributes {
    description
    "OSPF node scope attributes";
    container ospf-node-attributes {
        description
        "Contains node attributes";
        choice router-type {
            description
            "Indicates router type";
            case abr {
                leaf abr {
                    type empty;
                    description
                    "The node is ABR";
                }
            }

                    "The node is internal";
                }
            }
            case pseudonode {
                leaf pseudonode {
                    type empty;
                    description
                    "The node is pseudonode";
                }
            }
        }
        leaf dr-interface-id {
            when "./pseudonode" {
                description
                "Valid only for pseudonode";
            }
            type uint32;
        }
Appendix C. An Example

This section contains an example of an instance data tree in JSON encoding [RFC7951]. The example instantiates "ietf-l3-unicast-topology" for the topology that is depicted in the following diagram. There are three nodes: D1, D2, and D3. D1 has three termination points: 1-0-1, 1-2-1, and 1-3-1. D2 has three termination points as well: 2-1-1, 2-0-1, and 2-3-1. D3 has two termination points: 3-1-1 and 3-2-1. In addition, there are six links, two between each pair of nodes, with one going in each direction.
Figure 2: A Network Topology Example

The corresponding instance data tree is depicted below. Note that some lines have been wrapped to adhere to the 72-character line limitation of RFCs.

```
