A YANG Data Model for the Virtual Router Redundancy Protocol (VRRP)

Abstract

This document describes a data model for the Virtual Router Redundancy Protocol (VRRP). Both versions 2 and 3 of VRRP are covered.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc8347.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

This document introduces a YANG data model [RFC6020] [RFC7950] for the Virtual Router Redundancy Protocol (VRRP) [RFC3768] [RFC5798]. VRRP provides higher resiliency by specifying an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN.

The YANG module specified in this document supports both versions 2 and 3 of VRRP. VRRP version 2 (defined in [RFC3768]) supports IPv4. VRRP version 3 (defined in [RFC5798]) supports both IPv4 and IPv6.

1.1. Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “NOT RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.
The following terms are defined in [RFC7950] and are not redefined here:

- augment
- data model
- data node

1.2. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is defined in [RFC8340].

1.3. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

Table 1: Prefixes and Corresponding YANG Modules

2. Design of the Data Model

2.1. Scope of the Model

The model covers VRRP version 2 [RFC3768] and VRRP version 3 [RFC5798]. The model is designed to be implemented on a device where VRRP version 2 or 3 is implemented. With the help of a proper management protocol, the defined model can be used to:

- Configure VRRP version 2 or 3.
- Manage the protocol operational behavior.
2.2. Relationships with the Interface Model and IP Model

This model augments the interface data model "ietf-interfaces" [RFC8343] and the IP management model "ietf-ip" [RFC8344]. The augmentation relationships are shown as follows:

module: ietf-interfaces
  +--rw interfaces
  |    +--rw interface* [name]
  |        ...
  |        +--rw ip:ipv4!
  |            |    +--rw ip:address* [ip]
  |            |        ...
  |            +--rw vrrp:vrrp
  |                  |    +--rw vrrp:vrrp-instance* [vrid]
  |                  |        |    +--rw vrrp:vrid uint8
  |                  |        +--rw vrrp:virtual-ipv4-addresses
  |                  |            ...
  |                  +--rw ip:ipv6!
  |                      +--rw ip:address* [ip]
  |                      ...
  +--rw vrrp:vrrp
      |    +--rw vrrp:vrrp-instance* [vrid]
      |        |    +--rw vrrp:vrid uint8
      |        +--rw vrrp:virtual-ipv6-addresses
      |            ...

In the above figure, a tree node without a prefix is from the model "ietf-interfaces". A tree node with prefix "ip:" is from the model "ietf-ip". A tree node with prefix "vrrp:" is from the VRRP model specified in this document.

The "vrrp" container contains a list of vrrp-instance nodes, which are instantiated under an interface for a specified address family (IPv4 or IPv6).

Each vrrp-instance node represents a VRRP router state machine, as described in Section 6.4 of [RFC5798], providing the configuration and state information for the election process of a virtual router. The IP addresses on the augmented interface are the real addresses through which the VRRP router operates. The IPv4 or IPv6 address or addresses associated with a virtual router (described in Section 1 of [RFC5798]) are modeled as a list of IPv4 or IPv6 addresses under the vrrp-instance.
2.3. Protocol Configuration

The model structure for the protocol configuration is as shown below:

```
augment /if:interfaces/if:interface/ip:ipv4:
  +--rw vrrp
    +--rw vrrp-instance* [vrid] uint8
    |   ...  
    +--rw vrid
    |   ...  
    +--rw track
        +--rw interfaces
            |   +--rw interface* [interface] if:interface-ref
            |   ...  
            +--rw networks
                |   +--rw network* [prefix] inet:ipv4-prefix
                |   ...  
                +--rw virtual-ipv4-addresses
                    +--rw virtual-ipv4-address* [ipv4-address] inet:ipv4-address
                        ... 

augment /if:interfaces/if:interface/ip:ipv6:
  +--rw vrrp
    +--rw vrrp-instance* [vrid] uint8
    |   ...  
    +--rw vrid
    |   ...  
    +--rw track
        +--rw interfaces
            |   +--rw interface* [interface] if:interface-ref
            |   ...  
            +--rw networks
                |   +--rw network* [prefix] inet:ipv6-prefix
                |   ...  
                +--rw virtual-ipv6-addresses
                    +--rw virtual-ipv6-address* [ipv6-address] inet:ipv6-address
                        ... 
```
The model allows the following protocol entities to be configured:

- VRRP instance (version 2 or 3), representing a VRRP router.
- Virtual IPv4 or IPv6 address associated with a virtual router.
- Tracking interface, to detect interface connectivity failures.
- Tracking network, to detect network connectivity failures.

2.4. Protocol States

The model structure for the protocol states is as shown below:

```yang
module: ietf-vrrp

  +-ro vrrp
    |     // global operational states
    +-ro virtual-routers?  uint32
    +-ro interfaces?      uint32
    +-ro statistics       // global statistics
      +-ro discontinuity-datetime?  yang:date-and-time
      +-ro checksum-errors?        yang:counter64
      +-ro version-errors?         yang:counter64
      +-ro vrid-errors?            yang:counter64
      +-ro ip-ttl-errors?          yang:counter64

  augment /if:interfaces/if:interface/ip:ipv4:
    +-rw vrrp
      +-rw vrrp-instance* [vrid]
      |    +-rw vrid          uint8
      |    ...               ...
      +-rw track
        +-rw interfaces
          |  +-rw interface* [interface]
          |    +-rw interface       if:interface-ref
          |    ...                 ...
          +-rw networks
            +-rw network* [prefix]
              +-rw prefix        inet:ipv4-prefix
              ...
```yang
++-rw virtual-ipv4-addresses
    |   +++-rw virtual-ipv4-address* [ipv4-address]
    |       |   +++-rw ipv4-address inet:ipv4-address
    |   // per-instance operational states
    |   +++-ro state? identityref
    |   +++-ro is-owner? boolean

    |   +++-ro up-datetime? yang:date-and-time
    |   +++-ro master-down-interval? uint32
    |   +++-ro skew-time? uint32
    |   +++-ro last-event? identityref
    |   +++-ro new-master-reason? new-master-reason-type
    |   +++-ro statistics // per-instance statistics
    |       |   +++-ro discontinuity-datetime? yang:date-and-time
    |       |   +++-ro master-transitions? yang:counter32
    |       |   +++-ro advertisement-rcvd? yang:counter64
    |       |   +++-ro advertisement-sent? yang:counter64
    |       |   +++-ro interval-errors? yang:counter64
    |       |       |   {validate-interval-errors}?
    |       |   +++-ro priority-zero-pkts-rcvd? yang:counter64
    |       |   +++-ro priority-zero-pkts-sent? yang:counter64
    |       |   +++-ro invalid-type-pkts-rcvd? yang:counter64
    |       |   +++-ro address-list-errors? yang:counter64
    |       |       |   {validate-address-list-errors}?
    |       |   +++-ro packet-length-errors? yang:counter64

augment /if:interfaces/if:interface/ip:ipv6:
    +++-rw vrrp
        |   +++-rw vrrp-instance* [vrid]
        |       |   +++-rw vrid uint8
        |   +++-rw track
        |       |   +++-rw interfaces
        |       |       |   +++-rw interface* [interface]
        |       |       |       |   +++-rw interface if:interface-ref
        |       |       |   +++-rw networks
        |       |       |       |   +++-rw network* [prefix]
        |       |       |       |       |   +++-rw prefix inet:ipv6-prefix
        |   +++-rw virtual-ipv6-addresses
        |       |   +++-rw virtual-ipv6-address* [ipv6-address]
        |       |       |   +++-rw ipv6-address inet:ipv6-address
```

Liu, et al. Standards Track [Page 7]
This model conforms to the Network Management Datastore Architecture (NMDA) [RFC8342]. The operational state data is combined with the associated configuration data in the same hierarchy [YANG-Guidelines]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all "config true" (rw) and "config false" (ro) nodes defined in the schema.

The model allows the retrieval of protocol states at the following levels:

- VRRP instance (version 2 or 3), representing a VRRP router.
- Virtual IPv4 or IPv6 address associated with a virtual router.
- Tracking interface, to detect interface connectivity failures.
- Tracking network, to detect network connectivity failures.
- Global states and statistics summarizing all instances.
2.5. Notifications

This model defines the following VRRP-specific notifications:

notifications:

+---n vrrp-new-master-event
  |  +--ro master-ip-address    inet:ip-address
  |  +--ro new-master-reason    new-master-reason-type
+---n vrrp-protocol-error-event
  |  +--ro protocol-error-reason    identityref
+---n vrrp-virtual-router-error-event
  +---ro interface                      if:interface-ref
    +---ro (ip-version)
      |  +---:(ipv4)
      |     |  +---ro ipv4
      |     |     +---ro vrid    leafref
      |     +---:(ipv6)
      |        |  +---ro ipv6
      |        |     +---ro vrid    leafref
    +---ro virtual-router-error-reason    identityref

Each notification type is used to indicate a type of VRRP state change or error occurrence:

vrrp-new-master-event
  VRRP new master event, indicating that a new master has been elected.

vrrp-protocol-error-event
  VRRP protocol error event for a message that fails to reach a VRRP instance to be processed.

vrrp-virtual-router-error-event
  VRRP virtual router error event for a message processed on a VRRP instance.

In addition to the notifications specified above, the mechanisms defined in [Subscribed-Notifications] and [YANG-Push] can be used for other general notifications. These mechanisms currently allow the user to:

- Subscribe notifications on a per-client basis.

- Specify subtree filters or XML Path Language (XPath) filters so that only contents of interest will be sent.

- Specify either periodic or on-demand notifications.
3. Tree Structure

The VRRP YANG data model defined in this document has the following tree structure:

```
module: ietf-vrrp
  +--ro vrrp
    +--ro virtual-routers? uint32
    +--ro interfaces? uint32
  +--ro statistics
    +--ro discontinuity-datetime? yang:date-and-time
    +--ro checksum-errors? yang:counter64
    +--ro version-errors? yang:counter64
    +--ro vrid-errors? yang:counter64
    +--ro ip-ttl-errors? yang:counter64

augment /if:interfaces/if:interface/ip:ipv4:
  +--rw vrrp

         }
         mandatory true;
description
         "Indicates the virtual router on which the event has occurred."
      }
   }
}
5. IANA Considerations

This document registers the following namespace URI in the "IETF XML Registry" [RFC3688]:

-API END-
6. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/ietf-vrrp:vrrp

Unauthorized access to any data node of these subtrees can adversely affect the routing subsystem of both the local device and the network. This may lead to network malfunctions, delivery of packets to inappropriate destinations, and other problems.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

Unauthorized access to any data node of these subtrees can disclose the operational state information of VRRP on this device.

Appendix A. Data Tree Example

This section contains an example of an instance data tree in JSON encoding [RFC7951], containing both configuration and state data. (This example includes "iana-if-type", which is defined in [RFC7224].)

```
Virtual router IP address: fe80::1
   +-----------------+        +-----------------+
   |                 |        |                 |
   |    Router 1     |        |    Router 2     |
   |                 |        |                 |
   +--------+--------+        +--------+--------+
      |eth1                      |eth1                      |
      |fe80::11                  |fe80::12                  |
      +--------------------------+--------------------------+
            |fe80::51                  |fe80::52                  |
            +--------------------------+--------------------------+
                |Host 1                     |Host 2                     |
                |Default gateway:           |Default gateway:           |
                |fe80::1                    |fe80::1                    |
                +--------------------------+--------------------------+
```

Liu, et al. Standards Track [Page 40]
The configuration instance data for Router 1 in the above figure could be as follows:

```json
{
    "ietf-interfaces:interfaces": {  
        "interface": [ 
            { 
                "name": "eth1",  
                "description": "An interface with VRRP enabled.",  
                "type": "iana-if-type:ethernetCsmacd",  
                "ietf-ip:ipv6": { 
                    "address": [ 
                        { 
                            "ip": "2001:db8:0:1::1",  
                            "prefix-length": 64  
                        }, 
                        { 
                            "ip": "fe80::11",  
                            "prefix-length": 64  
                        } 
                    ],  
                    "forwarding": true,  
                    "ietf-vrrp:vrrp": { 
                        "vrrp-instance": [ 
                            { 
                                "vrid": 1,  
                                "version": "vrrp-v3",  
                                "priority": 200,  
                                "advertise-interval-centi-sec": 50,  
                                "virtual-ipv6-addresses": { 
                                    "virtual-ipv6-address": [ 
                                        { 
                                            "ipv6-address": "fe80::1"  
                                        } 
                                    ] 
                                } 
                            } 
                        ] 
                    } 
                } 
            } 
        ] 
    } 
}
```
The corresponding operational state data for Router 1 could be as follows:

```json
{
    "ietf-interfaces:interfaces": {
        "interface": [
            {
                "name": "eth1",
                "description": "An interface with VRRP enabled.",
                "type": "iana-if-type:ethernetCsmacd",
